X                ACKNOWLEDGEMENTS
X
X    ZMDM was derived from rz/sz for Unix  posted by
X    Chuck Forsberg (...!tektronix!reed!omen!caf ). We
X    thank him for his excellent code, and for giving
X    us permission to use and distribute his code and
X    documentation.
X
X    The code for detecting baud rate at startup is courtesy
X    of Brian Katzung (katzung@laidbak.UUCP). Thanks very
X    much!
X
X    Andy Nicola did a lot of testing of the new features.
X    Thank You very much!
X
X    Thanks to the many users on the net who wrote in.
X
X-------------------------------------------------------------------------
X    Enhancements since V1.2: (the last Usenet  release).
```

X
X o Some cleanup, moved common things around.
X   Some cosmetic additions.
X
X o MWC 3.0 compatible. The sample MW makefiles
X   reflect the setup required for MWC V 3.0.6.
X
X o Manx Aztec C compatible. Tested with V 3.6a
X   of the compiler. Produces the smallest code
X   of all the compilers tested. See config.h,
X   makefile.man and makefman.sta.
X   CAUTION: for MegaST and 4Meg ST owners--
X   The Manx Version will not work correctly
X   for you due to a bug in the start up file
X   -- we are still trying to figure out exactly
X   what the problem is!
X
X o Auto Baud Rate detection on startup:
X   Previously ZMDM would set the baud rate
X   to a compile time configurable rate on
X   startup (it needed to know the baud rate
X   to determine its default packet size). Thanks
X   to code contributed by Brian Katzung, now it
X   detects the baud rate on startup.
X   Of course you can set the baud rate
X   within ZMDM (by hitting '<HELP>' 'b').
X
X o Compile time option to use all available memory
X   as recv/send buffer. See DYNABUF, LEAVEALONE and
X   MINACC preprocessor symbols in config.h. If you
X   prefer to use a fixed size buffer, this is still
X   possible by not #define'ing DYNABUF and setting
X   BBUFSIZ. MegaST OK - thanks Andy Nicola.
X
X o Stand Alone versions of RZ and SZ can be made
X   by compiling the sources with the preprocessor
X   symbols 'STANDALONE' #define'ed. See the makefile
X   'MAKEFILE.STA' for more details.
X   Stand Alone versions DO NOT do any command line
X   argument expansions for wild cards or directories
X   (unlike the integrated ZMDM).
X   Stand Alone versions tested from within Gulam,
X   Flash and Intersect. Thanks to Andy Nicola for
X   testing these features.
X
X o Remote versions of ZMDM, RZ and SZ can be made by
X   compiling the sources with the preprocessor symbol
X   'REMOTE' #define'ed. A remote version listens and
X   does all its I/O thru the serial port. Of course
X   it has to be fired up from console. One of our
X   area BBS's provides this as a D/L option, where
X   the BBS program execs a remote ZMDM, and one you exit
X   you return back to the BBS program.

```
X
X           o Added -B (note: uppercase B) option to both RZ and SZ.
X         the -B function is a binary mode override, that disregards
X         the extension when deciding the transfer mode. This is
X         useful when say you are backing up your whole disk
X         to say a Unix host. (backup the exact image of the files),
X         or doing St-to-St type transfers.
X
X       o Now compatible with the PD DLIB library. The
X         pre-processor symbol DLIBS must be defined. Only
X         tested with the Alcyon version of the library.
X
X       o Added the phone module (a simple dialer with a
X         telephone numbers directory). This module is
X         only compiled in if the preprocessor symbol
X         'PHONES' is #define'ed. For those of you who
X         are familiar with XMDM, this module was directly
X         ripped out of there, with a small bug fix that
X         prevented it from running under TurboSt.ACC.
X
X       o Long packet lengths now allowed at slower baud rates
X         rather than insisting on using the default as the max
X         packet length. For instance
X            sz -l 1024 files..
X         will now send 1024 byte packets at low baud rates (<= 2400).
X         The corresponding change has been made to the unix
X         end of the software too.
X
X       o TurboSt.ACC note:
X            The high rez toggle (25/50 lines) on a
X       monochrome monitor will NOT work is TurboSt.ACC is
X       installed. The problem is on the TurboSt.ACC end. Using
X       the high rez toggle does'nt cause any ill-effect, it just
X       does not do anything.
X
X   Enhancements since V1.0:
X       o (This enhancement is only present when
X          you compile with the pre-processor symbol
X          `RECURSE' defined - see the makefile's)
X         sz now takes a  directory as an argument.
X         If the name of a directory is given as an
X         argument, then the contents of that directory
X         and all its subdirectories are sent. A new
X         option to sz is '-P <dir or file>'
X         (capital 'P' not 'p'), that
X         'prunes' the expansion of a directory. For
X         example if you wanted to send all the files
X         in the 'C' partition of your hard disk, except
X         the 'tmp', 'usr' and 'foo\bar' subdirectories, you would
X         issue the following command in the transfer
X         shell:
X
X            sz -f -P c:\tmp -P c:\usr -P c:\foo\bar c:\
```

```
X
X          Notice that you may specify multiple -P 'rune
X          options. The argument to the -P option may also be
X          the name of a file that you want to prune off.
X          Also note that to send full path names
X          to the remote end, the '-f' option is required,
X          otherwise the remote end will create all the
X          files in its current working directory. (Also
X          see CWRU extension to Unix 'rz', where 'rz' when
X          receiving full path names (ie. when you specify the
X          '-f' option to sz on the ST end) will create all
X          subdirectories required to receive the file). The
X          ST 'rz' always creates all subdirectories required
X          to receive a path when the other end is sz'ing with
X          the '-f' option. Also note that in both the rz's
X          all subdirectories are created relative to the
X          current working directory, even though the path may
X          specify an absolute path.
X
X           o File name mapping is slightly changed from V1.0.
X          When receiving a filename that has multiple '.'s
X          all but the last '.' is replace with an '_'. So
X          'foo.bar.ext' becomes 'foo_bar.ext'. Similarly
X          '123.456.789\aaa.bbb.ccc' becomes '123_456.789\aaa_bbb.ccc'.
X          As in V1.0, the filename and extension (of each
X          component of a path name) are truncated to 8 and 3
X          characters respectively. So '123.456789.ext\foobarbaz'
X          becomes '123_4567.ext\foobarba'. Also note that
X          while sending, '\'s are sent as '/'s. The ST drive
X          specifier part of a path name is never sent.
X          So 'c:\file.ext' is sent as '/file.ext' (remember:
X          that full pathnames are only sent when the '-f'
X          option is specified to 'sz').
X
X        o Many bug fixes since V1.0!
X
X------------------------------------------------------------------------
X
X
X    Zmdm consists of two main components:
X         o The terminal emulator
X         o The transfer shell
X
X    - The terminal emulator emulates a 80*25 terminal
X    (or optionally the 80*50 mode on Mono systems only).
X    It uses the escape codes of the bios built in enhanced
X    vt52 emulator. For UN*X users i have included the
X    termcap entry that we use.
X
X    - The transfer shell lets you send/receive files using
X    Xmodem/Xmodem-CRC/Xmodem-1K/Ymodem or Zmodem protocols.
X         In addition it provides UN*X csh like command for your
X    convenience, and does (TOS style) wild-card handling,
```

```
X        and (only single) quoting of arguments. Please note that
X    this is a convenience feature, and in no way does it
X    pretend to be compatible with csh or any other shell.
X    See the accompanying file YMODEM.DOC by Chuck Forsberg,
X    for details of the above transfer protocols.
X
X    This note describes the commands available from the
X    "transfer shell". The transfer shell is the built in command line
X    interface. In case you are wondering why we choose to
X    use a command line interface, the answer is quite simple.
X    The functions available have so many options and combinations
X    thereof, that it would be totally impractical if not impossible
X    to put them in menus/dialogues (each menu will have to be at least
X    3 levels deep). Of course it is much easier to type something
X    like 'sz -l 128 -L 128 *.c' than answering the at least three
X    dialogues required to pick up the same info. You enter the
X    transfer shell from the terminal emulator by hitting <HELP>
X    and choosing 'T' from the main menu. Once you are done using the
X    transfer shell, you simply hit <RETURN> to pop back into the terminal
X    emulator, exactly where you left off.
X
X    This program was written primarily for situations where you
X    are connected to remote hosts either directly or via modems.
X    The timing and error parameters are NOT suitable for hosts
X    such as CompuServe etc, where there may large delays or your
X    phone line is noisy. We distributed a program called XMDM earlier
X    that is very tolerant of delays/noisy lines and has been used
X    very successfully for BBS'ing around the country. XMDM has
X    conveniences such as dialing directories etc for that purpose.
X    If you have a old version of XMDM ( < V1.8) that does not have
X    dialing directories etc, please mail me for a new copy.
X
X    ZMDM has been tested in the following ways:
X    1) Between two ST's running ZMDM. 19200 Baud no problem!
X    2) With unix sz/rz running on a BSD4.3 on Vaxen.
X    3) With unix sz/rz running on Apollo Dn330/Dn300 under Aegis and
X       Domain IX (over a siologin line).
X    4) With unix sz/rz running on a Sun under SunOS.
X    6) With an Ibm At running Procomm using Ymodem/Xmodem.
X    7) With ForemSt bbs, with the BBS sending in Ymodem batch
X       mode. (note: ForemSt bbs's do not take batch uploads -
X       Matt Singer are you listening??)
X
X    8) With a Mac running MicroPhone using Ymodem mode.
X    9) With an Intel 210 box running Xenix (yech!).
X
X    UNIX users please note:
X        If the load on your system is high, the UNIX tty
X    driver drops characters when receiving at 9600 or higher baud rates.
X    There are two ways around this problem:
X    - use shorter packet and frame lengths using the `-l' and `-L' options
X    of SZ. For examples `sz -l 128 -L 128 files...' work most of
X    the time at 9600/19200 baud without any problem.
```

```
X
X    - reduce your baud rate to 4800 baud. Normally the first solution
X    works fine, but if you have an extraordinarily loaded machine
X    (or are running on a brain damaged 750 with DZ11's), then 4800 baud
X    works better.
X
X    - Those who have 3b2 boat anchors, the tty driver (at least on
X     the boxes we have) is totally useless over 1200 baud.
X
X    -----
X
X
XNAME
X     rb, rz - XMODEM, YMODEM, ZMODEM (Batch) file receive
X
XSYNOPSIS
X     rz [-Bpqtv]
X     rb [-pqtv]
X     rz [-cqtv] file
X
X
XDESCRIPTION
X     This program uses error correcting  protocol to receive files
X     over a serial port    from a variety of programs running under
X     TOS, PC-DOS, CP/M, Unix, and other operating systems.
X
X     The first form of rz (Receive ZMODEM) receives files with
X     the ZMODEM   batch protocol.     If the   sending   program
     does not
X     support ZMODEM, rz    steps down to YMODEM protocol after 50
X     seconds.  This delay can be eliminated by calling the pro-
X     gram as rb   .
X
X     When receiving with XMODEM or YMODEM, Rz accepts either
X     standard 128 byte sectors or 1024 byte sectors (YAM -k
X     option).  The user    should determine when the longer block
X     length actually improves throughput without causing prob-
X     lems.
X
X     If extended file information (file  length,   etc.) is
X     received, the file    length controls    the number of bytes writ-
X     ten to the   output dataset (YMODEM only), and the modify time
X     and file mode (iff    non zero) are set accordingly. A special feature
X     of the ST implementation is that if the remote end sends
X     full path names (-f option of sz) all required directories
X     will be automatically created on the ST end. The directories
X     will be rooted at the current directory and not at the root level.
X
X     The second   form of   rz receives a single file with XMODEM
X     protocol.    The user must supply the file name to both send-
X     ing and receiving programs.
X
X     When rz is invoked, Verbose is set to 2, causing frame by
```

```
X     frame progress reports to stderr.  This may be disabled with
X     the q option.
X
X
X     The meanings of the available options are:
X
X     B    (ZMODEM) force all files to be received in binary mode.
X      Useful for ST-to-ST transfers (for Ascii files where
X      you don't want LF to CRLF conversion). This is
X      a local override, specifying `-B' overrides any mode
X      the sender specifies (it however will still honor any `protect'
X      or `append' requests from the sender)
X      (Applicable to ZMODEM transfers only).
X
X     c    Request 16 bit CRC.  XMODEM file transfers default to
     8
X      bit checksum.     YMODEM   and ZMODEM normally use 16 bit
X      CRC.
X
X     p    (ZMODEM) Protect: skip file if destination file exists.
X
X     q    Quiet  suppresses verbosity.
X
X     t tim
X      Change timeout to tim tenths of seconds.
X
X     v    Verbose, more v's give more verbose. Info is also
X      appended to logfile 'rzlog' .  More v's generate more output.
X
XZMODEM CAPABILITIES
X     Rz  supports incoming ZMODEM binary  (-b), ASCII (-a), protect
X     (-p), and append (-+) requests, and ZMODEM   command
     execu-
X     tion. The incoming mode may be optionally overriden by specifying
X     the `-B' option to Rz, in which case all files will be received
X     in binary mode regardless of the incoming mode (protect and append will
X     still be obeyed).
X
X     Rz also supports incoming pathnames, and will recursively
X     create all subdirectories as required. Rz preserve file mod
X     times, and file protection. The translation of Unix protection
X     bits to ST file attributes is based on the Unix owner (07XX)
X     protection bits.  Presently, only read and write bits are considered.
X     All received pathnames are considered to be rooted at the
X     current working directory. Any leading '/' from unix systems
X     is discarded (ie. all incoming pathnames are considered unrooted,
X     and are locally 'planted' at the current working directory).
X     Ascii/Binary file modes are determined by examining the file
X     extension on the incoming path name. If the extension is one
X     of the following (case independent), then it is assumed to be
X     a binary file, ascii other wise. The ascii translation of
X     '\n' to '\r\n' is done locally for ZMODEM (only).
X     For X or Y modem the sender determines the file type (see
```

```
X     the file 'common.c' for the latest list).

X
XRZ/SZ(1)           ST Programmer's Manual              RZ/SZ(1)
X
XNAME
X     sz
X
XSYNOPSIS
X     sz [-+BdefkLlNnopqtuvy][-P <directory of file>]*  file ...
X     sz -X [-kqtuv] file
X     sz [-oqtv] -c COMMAND
X     sz [-oqtv] -i COMMAND
X
XDESCRIPTION
X     Sz uses the ZMODEM, YMODEM or XMODEM error    correcting proto-
X     col to send one or    more files over    a serial port to a
X     variety of   programs running under PC-DOS, CP/M, Unix, VMS, TOS
X     and other operating systems.
X
X
X     The first form of sz sends one or more files with ZMODEM or
X     YMODEM batch protocol.  Normally, only the   file name part of
X     the pathname is transmitted. Additional
X     information about the file is transmitted.     If the
     receiving
X     program uses this information, the  transmitted file length
X     controls the exact    number of bytes    written  to the output
X     dataset, and the modify time and file mode    are set
     accord-
X     ingly.
X
X     The second   form of   sz uses   the -X flag to send a single file
X     with XMODEM or XMODEM-1k protocol.   The user must supply the
X     file name to both sending and receiving programs.
X
X
X     The third form sends a single COMMAND to the receiver for
X     execution.    Sz exits with the COMMAND return value.
X
X
X     The fourth   form sends a single COMMAND to the receiver for
X     execution.    Sz exits as soon as the receiver has correctly
X     received the command, before it is  executed.
```

X
X
X   In SZ Verbose is set to 2, causing frame by frame pro-
X   gress reports to stderr. This may be disabled with the q
X   option.
X
X   The meanings of the available options are:
X
X   +   Instruct the receiver to append transmitted data to an
X   existing file   (ZMODEM   only).
X
X   B   (ZMODEM) force all files to be sent in binary mode.
X   Useful for ST-to-ST transfers (for Ascii files where
X   you don't want LF to CRLF conversion).
X   (Applicable to ZMODEM transfers only).
X
X   c COMMAND
X   Send COMMAND to the receiver for execution, return with
X   COMMAND's exit status.
X
X   d   Change all instances of "." to "/" in   the transmitted
X   pathname. Thus, C.omenB0000 (which is unacceptable to
X   MSDOS or CP/M) is transmitted as C/omenB0000.   If the
X   resultant filename has more than 8 characters   in the
X   stem, a "." is inserted to allow a total of eleven.
X
X   E   Escape only Ctrl-X control characters; normally XON,
X   XOFF, CR-@-CR, and Ctrl-X are escaped.
X
X   e   Escape all control characters; normally XON, XOFF, CR-
X   @-CR, and Ctrl-X are escaped.
X
X   f   Send Full pathname. Normally directory prefixes are
X   stripped from   the transmitted   filename.
X
X   i COMMAND
X   Send COMMAND to the receiver for execution, return
X   Immediately upon the receiving program's successful
X   reception of the command.
X
X   k   (XMODEM/YMODEM) Send files using 1024   byte blocks
X   rather than the default 128 byte blocks. 1024 byte
X   packets speed   file transfers at high bit rates. (ZMO-
X   DEM streams the data for the best possible throughput.)
X
X   L N Use ZMODEM sub-packets of length N. A larger
     N (32 <=
X   N <= 1024) gives slightly higher throughput, a smaller
X   N speeds error recovery. The default is 128 below 300
X   baud, 256 above 300 baud, or 1024 above 2400 baud.
X
X   l N Wait for the receiver to acknowledge correct data every
X   N (32 <= N <= 1024) characters. This may be used to

```
X      avoid  network  overrun  when XOFF flow control is lack-
X      ing.
X
X     n    (ZMODEM) Send   each file if destination file does not
X      exist.  Overwrite destination  file if  source file is
X      newer  or longer than the destination file.
X
X     N    (ZMODEM) Send   each file if destination file does not
X      exist.  Overwrite destination  file if  source file has
X      different length or date.
X
X     o    (ZMODEM) Disable automatic selection of 32 bit CRC.
X
X     p    (ZMODEM) Protect existing destination   files by skipping
X      transfer if the destination file exists.
X
X     q    Quiet  suppresses verbosity.
X
X     r    Resume interrupted file transfer.  If   the source file
X      is longer than the destination file, the transfer com-
X      mences at the   offset in the source file that equals the
X      length of the   destination file.
X
X     t tim
X      Change timeout to tim tenths of seconds.
X
X     u    Unlink the file after successful transmission.
X
X     v    Verbose causes a list of file  names to be appended to
X      szlog .More v's generate more output.
X
X     X    Send a single   file with XMODEM or XMODEM-1k protocol.
X
X     y    Instruct a ZMODEM receiving program to overwrite any
X      existing file   with the same name.
X
X     P <directory or file>
X    (ZMODEM) Sz may be given the name of
X    a directory, in which case it will send the contents
X    of the directory, and all the subdirectories thereof.
X    The -P 'Prune' option is used to prune out the named directory
X    or file while expanding the directory tree. Multiple
X    -P options may be specified. This option
X    is only present when the source is compiled with the
X    pre-processor symbol `RECURSE' defined.
X
X    SZ guesses the file mode by examining the filename extension as
X    discusses under RZ above. SZ -f send full pathnames with '\'
X    converted to '/'. The ST drive specifier is never sent.
X

X     ZMODEM.DOC, YMODEM.DOC, IMP(CP/M),  cu(1), Professional-YAM
X     manual, sz(omen), usq(omen), undos(omen)
```

```
X
X     Compile time options required for various operating systems
X     are described in the source file.
X
XNOTES
X    Depending on your file structure, when using the recursively
X    descend a directory option of Sz, ZMDM can demand a lot of
X    dynamic memory. When the pre-processor symbol `RECURSE' is
X    defined, for Mark Williams C, `_stksize' is set to 16K. If
X    you are using Alcyon C, please use a decent version of
X    GEMSTART.S. We use the version from pratt@atari with
X    memory model (STACK=1), which gives quarter of available
X    memory to stack+heap. Note that all the dynamic memory is
X    taken off the program heap (for Alcyon, and off the Arena
X    above the stack for Mark Wiliams), ie. ZMDM uses `malloc' not
X    `Malloc'.
X
X    It is possible to run out of dynamic memory when descending
X    a file structure with a lot of files and/or deep-hierarchies.
X    The simplest way to work around this problem is to do the
X    sending in parts by using the -P rune option of Sz. For
X    instance if you run out of memory while trying to send your
X    C partition, you may want to prune out some directories and
X    send things in parts. In my case i backup my C partition to
X    our unix host in the following manner:
X
X    sz -f -P c:\bin -P c:\lib c:\  /* send eveything in the C
X                          partition except the 'bin'
X                          and 'lib' subdirectories */
X
X    sz -f c:\bin c:\lib           /* then send the 'bin' and 'lib'
X                          directories */
X
X    The second solution depends on if you are using Mark Williams
X    or Alcyon C libraries. If you are running out of memory because
X    of deep hierarchies, you need to increase the stack. If you are
X    running out of memory because of a lot of files, then you
X    need to decrease the stack to allow for a larger arena in
X    the case of MWC (and trade-off for depth), or in the case of
X    Alcyon you need to increase stack+heap. On systems with a
X    large Ramdisk or many ACCs make sure you have enough space
X     before doing this.
X
X    The TTY input buffering on  some systems may not allow long
X    blocks or streaming input,  especially at high baud rates.
X    The Pro-YAM zmodem l numeric parameter may be set to a value
X    between 64    and 1024 to limit the burst length.
X
XBUGS
X     THIS SOFTWARE IS STILL UNDER DEVELOPMENT AND ALMOST POSITIVELY
X     CONTAINS BUGS. PLEASE REPORT ALL SUCH CRITTERS TO mandrill!bammi.
X
X     Pathnames are restricted to 127 characters.  In XMODEM sin-
```

```
X     gle file mode, the    pathname given on the command line is
X     still processed as    described above.
X
XFILES
X
X     (rz|sz)log   stores debugging output generated with -vvv[v]*
X           option.
X
XOTHER COMMANDS
X    The following command are available in the
X    transfer shell:
X
X    <regular-expression> ::= <file name> | <wild card> |
X                   'quoted string'
X    NB: A quoted string cannot contain embedded single quotes. There
X        is no escape character available in a quoted string.
X
X    rm,   remove files
X         rm [-i] <regular expression>
X         -i ::= interactive mode, you are prompted before
X                file(s) are removed.
X
X    cp,   copy files
X         cp <many files> directory
X              copy all files into directory
X              cp *.c d:\foo - copy all C files into foo
X                           directory on drive D:
X         cp <file> <directory>
X              copy file to directory\file.
X
X         cp <file> <file>
X              file to file copy
X              'cp file con:' to get the listing of a file.
X
X    ls,   list directory
X         ls [wild card]
X         ls without an argument will list all files in the
X         current directory. If an argument is given, then
X         only files matching the wild card will be listed.
X              ls *.c - list all C files in current directory
X              ls d:\foo - list all files in foo directory on D:
X              ls d:\foo\*.c - list all C files in foo directory
X
X    cd,   change working directory
X         cd directory
X
X    md,   make a directory
X         md directory
X
X    rd,   remove a directory
X         rd directory
X         Due to a Gemdos bug, you may have to say 'rd directory'
X         twice to get rid of directory. This happens when you
```

```
X         try to remove a directory that you have never visited.
X
X    pwd,  print  working directory
X         prints the current working directory
X
X    df,   check free space
X         df [device]
X         df without an argument will show free space on current drive.
X         df with an argument will show free space on specified drive.
X
XTERMCAP
X    Termcap entries that may be used for the terminal emulator.

X
XCOMPILING
X
X    The source provided with this distribution will compile
X    with either ALCYON C V4.14 as distributed with the
X    Atari Development System,  with Mark Williams C Version 2.00
X    or later and with MANX Aztec C (V3.6a tested).
X    (please note that the system will NOT compile with earlier
X     versions of either compiler.)
X
X    Edit config.h.
X
X    If you are using Alcyon(and ALN for the linker), check paths in LNK
X
X    Define the preprocessor symbol `RECURSE' if you
X    want the sz to accept directory names(and send its
X    contents), and for the -P option.
X
X    To compile with Alcyon see the file `makefile.alc'
X    To compile with Mark Williams C see the file `makefile'
X    To compile with Manx Aztec C see the file `makefile.man'
X
X    Rename ZMDM.PRG to ZMDM.TOS if you so desire.
X
XMORE ALCYON NOTES:
X    -- Some people seem to have a bad version of as68 with Alcyon,
X     that does'nt handle static variables too well (ie. symbols of the
X     form "`name" in the assembler). Please make sure yours is not one of
X     these.
X
X    -- Use a reasonable version of gemstart.s - ie. one which gives you
X     a decent amount of stack+heap space. One of the nicer versions
X     floating around is the one written by Alan Pratt @atari, that
X     gives you the various memory model options, and corrects the
X     bug with the bdos call as suggested by Robert Royar on this net.
X
X    -- Do NOT use the `fix' distributed on CompuServe developers forum
X    in the file WILDFI.ARC (in Dl7). This fix does'nt fix anything,
X    it breaks everything!
X
XKNOWN BUGS
X    -v's on the ST end don't do a thing!
X
X    If a receive is cancelled/aborted, the receive file
X    buffer is not flushed to the file. Personally, i
X    view this as a feature rather than a bug, so it is
X    unlikely to be `fixed'.
X

Submitted-by: cfc@wjh12.harvard.edu (Christopher F. Chabris)
Posting-number: Volume 1, Issue 49
Archive-name: ops5/part01

[I don't have Cambridge Lisp, so I can't test this. -sg]

In the past, several people have asked me about a version of the OPS5
production system interpreter for Cambridge Lisp on the ST. This version
```

was given to me by John Fitch, who implemented the ST version of Cambridge Lisp, about two years ago. I submit it with no claims as to workability, usefulness, bug-freeness, etc -- it is just here for those who want to hack with OPS5 and a large program on Cambridge Lisp and the ST. It might also work for other implementations of Cambridge Lisp on other machines, such as the Amiga. And of course, I am not responsible in any way for supporting it. I hope some people enjoy it.

```
#!/bin/sh
# shar:  Shell Archiver  (v1.22)
#
# This is part 1 of a multipart archive
# do not concatenate these parts, unpack them in order with /bin/sh
#
#    Run the following text with /bin/sh to create:
#      ops5
#
if test -r s2_seq_.tmp
then echo "Must unpack archives in sequence!"
     next=`cat s2_seq_.tmp`; echo "Please unpack part $next next"
     exit 1; fi
sed 's/^X//' << 'SHAR_EOF' > ops5 &&
X%============================================================================
X% OPS5 heavily modified by John Fitch to improve efficiency and
X% functionality.  This is a Cambridge LISP version.

Posting-number: Volume 1, Issue 52
Archive-name: assist2/part01

[This accessory contains a clock-setter and some disk utilities. Uuencoded
 resource files are included. I got it to compile under Laser C. -sg]

```
#!/bin/sh
# shar:  Shell Archiver  (v1.22)
#
# This is part 1 of a multipart archive
# do not concatenate these parts, unpack them in order with /bin/sh
#
#    Run the following text with /bin/sh to create:
#      ASSIST2.C
#      ASSIST2.H
#      ASSIST2.MAK
#      ASSIST2.RSC
#      ASSIST2.RSD
#      INCLUDE.H
#

Archive-name: errorchk

Here is another small memory-resident program to be placed in the AUTO folder.
    Did you also had times you wanted to see a program's final (error?) message when it flashed over your screen and the desktop was painted all over it.
    This little program checks whenever a program exits if the caller was the desktop (it does this by following the links in the basepages); if so, a message is printed and you can press a key to continue.
    The program sets the GEM program exit vector that is at address 0x408; this vector usually points to a RTS statement (i.e. does nothing). After a keypress a jump is made to the old vector (in case it WAS used).
    This program also prevents the need of coding similar messages into every program that can be called from the desktop.
    It was assembled using the assembler and linker that come with the GST-C compiler, resulting in a program length of 240 bytes.

    My name and address:

Archive-name: joinprnt

The following nice little program (JOINPRNT.PRG) should be placed in the AUTO folder, so that it is made resident at startup time.
After pressing ^P (control-P) all screen output (but not the graphic part) is also directed to the printer. In this way every program can have its hardcopy without any trouble. Pressing ^P again toggles back to normal behaviour.
A few remarks:
A) The BIOS vector is altered to achieve this. This is however done transparently (using the old vector when necessary).
B) VT52 escape sequences are not send to the printer (the ESC and the following character are ignored).
C) The ^P has to be read first (by whatever program; presumably a shell); this is generally not a problem.
D) The program has been used by myself for about a month now, without problems.

The program was assembled and linked with the assembler and linker that come with the GST-C compiler, using the commands:
ASM.PRG JOINPRNT
LINK.PRG JOINPRNT
The resulting code was 246 bytes in size.

XCOLOR (3L)                                COLOR(3L)
X
X
XNAME
X    COLOR - Library routines to manipulate the color palette from
X         within a 'C' program.
X
XAUTHOR
X    Bob Silliker

XSYNOPSIS
X    save_color(handle, flag)
X    int handle, flag;
X
X    do_color(handle)
X    int handle;
```

```
X
XDESCRIPTION
X    These library routines provide a means of manipulating the color
X        palette through a dialog box.
X
X    Save_color() is used to  save/restore the  current color pallett
X    settings into/from a global rgb array called old_rgb[][3].  This
X    usually is called at the start of the application with a flag
X    value of 1.  This causes the current settings to be saved.  When
X        the program terminates, this routine should be called with a flag
X        value of 0.  This will cause the current  settings to be restored.
X        Handle is what you get from opening a virtual workstation.
X
X    Do_color() displays a dialog and allows the user to set the RGB
X    of any of the active colors.  The user can cancel the operation
X    which will restore the colors to what they were before do_color()
X    was called.  The default exit button is CANCEL so if the user
X    manages to set foreground and background colors the same pressing
X    the <RETURN> key will cancel the operation.
X
XWARNING
X    Save_color() must be called  with a flag value of 1 before a call
X    is made to do_color().  If you don't then all colors will be set
X    to 0.

XThis is the source for a dialog to play with the color palette.  It was
Xintended that this be an example of how to the the 'rsctoc' program.
XHowever, as distributed the source can be used without 'rsctoc'.  This
Xwas compiled under Laser C and will probably need some mods to work
Xwith another compiler.
X
Xcolor.doc - manual page for the color library routines.
X
Xtest.c    - is a test program that calls the routines provided by color.
X
Xcolor.c   - is the source code that handles the dialog box.
X
Xobjects.c - is the object tree for the color dialog and was generated
X           by running the 'rsctoc' program on the 'color.rsc' file.
X           See the makefile for command line args.
X
Xcolor.rsc - resource file for the color dialog.
X
Xcolor.h   - header file created by the Megamax RCP program.
X
Xcolor.def - another file created by the Megamax RCP program that contains
X           information about the object names and types.
X
Xmakefile  - makefile that I use with my version of make.  This will probably
X           need some changes.

X
XRsctoc is a program to generate C code out of a resource file.  It has been
Xwritten to be compiled with the Megamax Laser C compiler.  I do not know
Xhow much work it would be to compile it with another compiler.
X
XThe makefile that I use will not be of much use.  I have provided it only
Xas a guide.

X
X    SYNOPSIS
X        rsctoc.ttp rsc_file [-p prefix] [-o file]
X
X    DESCRIPTION
X        Rsctoc is a program to generate C code from a resource file on an
X        Atari St computer.  It will handle the following types; OBJECT,
X        TEDINFO, ICONBLK and BITBLK.  If the command is executed with only
X        a path to the rsc_file then the C code will be displayed on the
X        screen.  To send the output to a file you can use the '-o file'
X        option or to redirect the output with '>file'.
X
X        The C code that is generated includes a small routine to fixup the
X        objects by calling rsrc_obfix() on each object to convert the
X        object's location size from character coordinates to pixel coordinates.
X        The routine is that is called to fixup the objects is 'fix_objects()'
X        and should be called once during program initialization (calling it
X        more than once is interesting but not useful).
X
X        The -p prefix option is used to add a short unique prefix to the names
X        of the structures, routine and macros that rsctoc creates.  This is
X        very useful when creating library routines that have trees embedded
X        in them (providing a means of preventing name conflicts).
X
X        If rsctoc is executed in the following way
X
X                    rsctoc rsc_file -p my -o file
X
```

```
X        Then the C code generated would have 'my' added to the start of the
X        structures, routine and macros.
X
X                    rs_tedinfo      would be      myrs_tedinfo
X                    NUM_TI          would be      myNUM_TI
X                    fix_objects     would be      myfix_objects
X
X    NOTES
X        The program DOES NOT generate the arrays rs_strings[], rs_frstr[],
X        rsfrimg[], or rs_imdope[] arrays.  The program DOES generate the
X        arrays rs_tedinfo[], rs_object[], rs_trindex[], rs_bitblk[],
X        rs_iconblk[] arrays as well as defines the macros NUM_TI, NUMOBS,
X        NUM_TREE, NUM_BB and NUM_IB (modified by the prefix of course).
X
X        Any names that you assigned to objects, trees, images or icons can
X        still be used in your program to access these elements. The program
X        will only handle 512 trees (not objects, images or icons which are
X        only limited by the resource file structure) in one input resource
X        file.
X
X    BUGS
X        There are no known bugs in V1.0. (:->)
X        If you find one fix it.

Submitted-by: uunet!mcvax!philmds!leo (Leo de Wit)
Posting-number: Volume 1, Issue 58
Archive-name: fastdump

another submission for the ST. It runs in any case on a color monitor
(med and high res); I have no chance of testing it on a monochrome
monitor.

The following program (FASTDUMP.PRG) should be placed in the AUTO
```

folder, so that it is made resident at startup time. After pressing
Alternate-Help the screen is dumped to the printer (at least, a copy of
the graphic image 8-). It is much faster than the standard routine but
only suitable for text screens.

The program was compiled and linked with the compiler and linker that
come with the Lattice-C compiler, as follows:

    Click on LC.TTP, then enter:
fastdump

    Create a file fastdump.lnk with contents (2 lines):
INPUT fastdump.bin
LIBRARY clib.bin

    Click on LINK.TTP, then enter:
-with fastdump

The resulting code was 1924 bytes in size.

 *    fastdump.c  version 1.1 of 19 June 1988    (C) L.J.M. de Wit 1988     *
 *                                                                          *
 * This software may be used and distributed freely if not used commercially  *
 * and the originator (me) is mentioned.                                    *
 *                                                                          *
 ****************************************************************************
 *
 * NAME
 *    fastdump - fast ascii screen dump
 *
 * SYNTAX
 *    fastdump.prg
 *
 * DESCRIPTION
 *    Fastdump does a fast screen dump whenever the Alt Help key is pressed.
 *    It reads the screen memory to match on font characters; matched
 *    characters are printed as-is, non-matched characters as spaces.
 *    It has some intelligence as to avoid printing trailing spaces.
 *    It is very useful as afterwards printer, e.g. after a compilation with
 *    error messages, or a program that exits with failure messages, and also
 *    for printing source/text from within an editor, or for programs that do
 *    not provide for hardcopy output.
 *
```

```
 *    Fastdump should be in the AUTO folder as FASTDUMP.PRG so that it is
 *    installed memory resident when the system is loaded. It then overrides
 *    the standard screen dump routine.
 *
 * BUGS
 *    The program does not provide for RS232 printing yet. The Centronics port
 *    is used.
 *
 *    The routine is not used when it is called from the XBIOS. This is because
 *    of old disk-based TOS versions that had the dump vector hardcoded. A
 *    future release of this program (if there will be any &-) will use the
 *    screen dump vector at address 0x502.
 *
 *    Characters in reverse video are not matched yet with their reverse images
 *    so that reverse video now results in spaces. Also something for the next
 *    release.
 *
 * DECISIONS
 *    The current version is compiled with a Lattice C compiler; people using
 *    other compilers should be aware of the fact that on entrance of do_dump()
 *    the contents of A4/A5 will be different from what it was when the
 *    program was started (being an interrupt-routine) so that register
 *    relative addressing cannot be used in this case (or A4 should be loaded
 *    when the routine is entered). For Lattice C absolute addressing is the
 *    default so that there was no problem in this case.
 *    After compilation the module should be linked only with the standard
 *    library (for the gemdos function). So the link file should contain:
 *            INPUT fastdump.bin
 *            LIBRARY clib.bin
 *    startup.bin is not used, and the function startup() is used as entry point.
 *    The size of the resulting code is much smaller now (not using stdio etc).
 *

Submitted-by: ucbvax!ihnp4!stag!trb (Todd Burkey)
Posting-number: Volume 1, Issue 59
Archive-name: readme12

The following is the source code and executable for a README
application that implements my new POPHELP mechanism. Full source
code is included for README (MW C) and it runs in both Medium Res
(RGB) and High Res (mono). A menu configuration file that describes
POPHELP is also included (and automatically presented to the user
when they run README.PRG).

The program is self documenting (it would be silly if it wasn't).
My primary goal in writing the POPHELP routines was to beef up
HDSCAN's interactive help and to lay the groundwork for full popup
menu control for users of HDSCAN. It ended up to be such short and
simple code that I decided to put it out for others to use, add to
their own programs, or simply learn some coding techniques from.
The code has been implemented in the next version of HDSCAN (took
about 2 hours to integrate it) and does tend to snaz up your application
some. One of the local developers has even created a README pophelp
configuration file for Mark Johnson C. Enjoy.

Some features of POPHELP:

1) External Help file driven (think of it as a help resource file).
   Can also be fully integrated into the application code.
2) Allows context sensitive help applications to be easily written.
3) Users can wander through the help popups via arrow keys or the
   mouse.
4) The popups are very fast and consist of selectable and
   non-selectable text in shadowed popup boxes.
5) The implementor can vary screen color from popup to popup.
6) External files can be 'fed' into a popup menu (saving on memory
   for little used/accessed help topics).

Some features of README:

1) Originally intended as a test vehicle for checking out the
   POPHELP routines, I actually am using README to replace my README
   files for HDSCAN and DISKSCAN. Much cleaner user interface.
2) Allows a user defined 'front page' from which the HELP key can be
   pressed to allow a user to 'learn' about an application in a
   logical fashion.

X   This program shows one use of the POPHELP mechanism (Copyright 1988 by
X   Todd Burkey). POPHELP is intended to be a 'clean' way of presenting help
X   to users of a program and was also written to demonstrate in source code
X   how to do those confusing linea/vdi/etc things that all of our manuals kind
X   of gloss over. I am not saying that my methods are proper coding or even
X   close, but at least it works. In order to ensure that this code and the
X   techniques involved stay accessible to the public at large, I have to make
X   the following stipulations:
X
X     1) This program and source code may be freely distributed as long as no
X        profits are made in the process (Club Disks of the Month and BBS's are
X        excepted, of course.)
X     2) All derivatives of the routines in this code must include this notice
X        verbatim and are similarly subject to the conditions in 1, above.
X     3) No warrantees are made as to the usefulness or safety of using this
X        code. The user uses it at his/her own risk.

XT:    POPHELP By Todd Burkey
XT:
XT:Uh-oh. You need HELP for POPHELP?
XT:OK, the first thing to remember is
XT:that in POPHELP, you really only
XT:need to use the four arrow keys
XT:and the ESC key. The up and down
XT:arrows will move you up and down in
XT:the current pop-up...but only when
XT:there is selectable (blue) text in
XT:the popup. Note that this popup has
XT:NO selectable text...you can just
XT:read it and exit. Which brings us
XT:to the left and right arrow keys.
XT:The right key gets you into a menu,
XT:while the left key moves you back
XT:out of a menu. The ESC key? It gets
XT:you out of the popups altogether.
```

```
XT:You can press the LEFT ARROW now.

XT:README is a generic application that I hope you find useful in setting
XT:up useful on-line documentation for programs you develop. Feel free to
XT:give out copies of README to others who are learning C or who you feel
XT:could use a better help mechanism. I will try to keep the pophelp file
XT:formats upwards compatible, so keep your eyes open for future releases
XT:of improved versions of this program.
X

XY:4
XT:This program shows one use of the POPHELP mechanism (Copyright 1988 by
XT:Todd Burkey). POPHELP is intended to be a 'clean' way of presenting help
XT:to users of a program and was also written to demonstrate in source code
XT:how to do those confusing linea/vdi/etc things that all of our books kind
XT:of gloss over. I am not saying that my methods are proper coding or even
XT:close, but at least it works. In order to ensure that this code and the
XT:techniques involved stay accessible to the public at large, I have to
XT:make the following stipulations:
XT:
XT: 1) This program and source code may be freely distributed as long as no
XT:    profits are made in the process (Club Disks of the Month and BBSs are
XT:    excepted, of course.)
XT: 2) All derivatives of the routines in this code must include this notice
XT:    verbatim and are similarly subject to the conditions in 1, above.
XT: 3) No warrantees are made as to the usefulness or safety of using this
XT:    code. The user uses it at his/her own risk.

XT:Colors can be changed from the default setup dynamically within the menus,
XT:but extreme care should be taken so you don't screw things up for people
XT:who use monochrome monitors. The technique is quite simple. Within the
XT:MENU.TRB file, include the following fields when you want a new color:
XT:0:006          <--change color 0 to light blue (normal background)
XT:1:600          <--change color 1 to red (non-selectable text)
XT:2:000          <--change color 2 to black (for the shadow)
XT:3:775          <--change color 3 to off white (popup background).
XT:Note that the default color can be over-ridden by specifying a new color
XT:for menu # 1 (the first popup that is displayed by POPHELP).

X                            POPUP HELP MENU DEMO
X                               by Todd Burkey
X
X  Hate clicking on and paging through README files?  Well, give this program a
X  try. README.PRG is a standalone program that uses my POPUP HELP mechanism to
X  create nice, heirarchical help menus. Originally intended for HDSCAN, I have
X  decided to release this README application w/source code so others out there
X  can use it, learn from it, and hopefully even improve on it. POPHELP is easy
X  to use, just press HELP and use the arrows to move around.  Press HELP again
X  (while inside POPHELP) if you get confused.  Yep, even mono-chrome and mouse
X  lovers are supported. Some technical notes:
X
X    1) POPHELP is file driven. A procedure reads in MENU.TRB which describes
X       the popup hierarchy. Think of this as a help resource file.
X    2) POPHELP has a limit of 100 popup menus (as compiled herein). Menu 0 is
X       for people who get confused.
X    3) Short (<24 line) files can be automatically shown (see the examples.)

Submitted-by: uunet!mcvax!philmds!leo (Leo de Wit)
Posting-number: Volume 1, Issue 60
Archive-name: nlqps

Another nice program for printer owners. That is, if your printer does
not have NLQ capability, but does have double-density graphics. It is,
at least I think it is, as good as NLQ in hardware; besides you have
the possibility of proportional spacing.
    The program consists of 3 modules: newstart.c, nlqps.c and
nlqpsdat.c and a header file: nqlps.h. It is compiled and linked with
Lattice C, but it should be easy to adapt it for other compilers. The
printer it was tested with was a Star Gemini-10X.
   Generation procedure for Lattice: compile all three .c files, then
link them, together with the C library, to form a program named
nlqps.ttp. The correct linking procedure : create a link file,
nlqps.lnk, that contains:

```
INPUT newstart.bin
INPUT nlqps.bin
INPUT nlqpsdat.bin
LIBRARY clib.bin
```

and then give the command:
```
LINK.TTP -WITH NLQPS -NOLIST -PROG NLQPS.TTP
```

   For a manual page I refer to the first comment in nlqps.c

X * and the originator (me) is mentioned.                                    *
X *                                                                          *
X ****************************************************************************
X *
X * NAME
X *    nlqps - print with Near Letter Quality and Proportional Spacing
X *
X * SYNTAX
X *    nlqps.ttp [-n|-N] [file ...]
X *
X * DESCRIPTION
X *    This program is meant for use with printers that have no NLQ capability.
X *    The printer SHOULD have double density graphics capability and capability
X *    of sending a LF of half a scanline high (1/144 inch). The Star Gemini-10X
X *    is an example. If the escape sequences for your printer are different,
X *    you should alter the macros LP_SMALL_LF() (1/144 inch linefeed),
X *    LP_BIG_LF() (23/144 inch linefeed) and LP_DD_GRAPH() (double density
X *    graphics) accordingly.
X *
X *    The program prints your file(s) (or standard input for pipes) in a
X *    standard NLQ fashion, i.e. the line is printed twice in graphics mode
X *    with complementary fonts and a very small linefeed inbetween. The total
```

```
X *    linefeed is still 1/144 + 23/144 = 1/6 inch, which is a standard
X *    line height.
X *
X *    A nice feature of this program is that it does proportional spacing as
X *    well; if this is not desired (e.g. when printing tables, columns, program
X *    listings) this feature can be turned off by the -n switch; n for
X *    non-proportional (-N is the same and only needed because silly uppercase
X *    conversion of the parameter line when running TTP's from the Desktop).
X *
X * BUGS/SHORTCOMINGS
X *    The program is not activated when printing files from the Desktop. The
X *    question is: Is automatic NLQ printing desired (printing without NLQ
X *    becomes harder) ?
X *
X *    The program does not yet provide for different NLQ fonts. This is however
X *    not hard (loading a file into the nlqfont struct) but only useful with
X *    an editor program for such a font.
X *
X * DECISIONS
X *    For compactness of code the module should be linked with newstart.bin
X *    instead of startup.bin (the standard first module and entry point of the
X *    program). This new startup module avoids using stdio (not needed here),
X *    resulting in a much smaller program: 4435 bytes instead of 14036!
X *    The standard C library IS used (for the gemdos/bios interface).
X *    One should create a link file, nlqps.lnk, that contains:
X *            INPUT newstart.bin
X *            INPUT nlqps.bin
X *            INPUT nlqpsdat.bin
X *            LIBRARY clib.bin
X *    and the command to be given is:
X *    LINK.TTP -WITH NLQPS -NOLIST -PROG NLQPS.TTP
X *    The function startup() in newstart.c is used as entry point, so
X *    newstart.bin must be the first module to be linked in.

Submitted-by: decwrl!pacbell!dssch1!dsuthers
Posting-number: Volume 1, Issue 61
Archive-name: varlint

The following is a utility for those of us who program in 'C', but
are lousey typists.  The program checks for:
scanf   sccanf   fscanf  printf   sprintf   fprintf
function calls, and checks their syntax.  It is a SUPPLEMENT to lint
(or a good syntax checking compiler); It is not a replacement for lint.

[Executable is being posted to the binaries group. -sg]

VARLINT(Local)              'C' Utility       VARLINT(Local)

SYNOPSIS
   varlint <program name> ... <program name>

HISTORY

   This program was developed under Lattice C on an Atari 520 ST. It
   is compatable with (and tested on) DEC 11/70 and AT&T 3B5 processors,
   running SYS V, and earlier versions too.  There is no reason that it
   won't compile on any system.

USAGE

   This program is designed to assist when coding in C.  It double checks
   your syntax for those funtions that have a variable number of arguments,
   and use the same syntax as printf / scanf.

WHEN TO USE IT

   If your program passes lint, and it compiles ok, but crashes any-way,
   or doesn't quite work right, try varlint.

   Mistakes with scanf or printf are one of the most frequent causes of
   intermittant crashes.  "Lint" does not check the syntax, and neither
   do most of the compilers.

CAPABILITIES:

   This program will detect and print out the following conditions.

     1)   More arguments following the control string than there are
          percent signs in the control string.
     2)   Too many arguments as compared to the control string.
     3)   Mis-matches between the argument type and the item in
          the control string.
     4)   Null control string.
     5)   Unknown specifiers after a percent sign in a control string.
        6)   Missing ampersands (&) in front of numbers. (scan functions)
     7)   Will not complain about valid uses. (allows funtion calls as
          arguments, strings as *chars, etc.

RESTRICTIONS:

     1)   It does not yet check to ensure that the variables you name
          are indeed the type you claim.
     2)   The use of a character array is allowed by the scanf / printf
```

```
          functions, but is not yet verified by the program.  You
          are notified of "un-recognized contstruct" in these cases.

/* FLIP HISTORY & MANUAL */

/* HISTORY:
 *=========
 * v 2.7  June 25 88
 *     Twister code works on NEW ROMS!
 *   2.6c when command is just "CR", keep the old track map
 *   2.6b tells when copies an executable boot to detect virii
 *   2.6a bug de 'r' repaired
 *        No checksum done if no previous checksum
 *        option 's' for single instead of double (double=default)
```

```
* v 2.6  Feb 27 88
*   2.5c re-designing of command parsing
*     formats disk ('f' command)
*     randomization of serial # at each copy
*   2.5b t can override disk
*     ESC aborts without confirm
*   2.5a no ESC to another disk, BS!
*     aborts on key even in format
*     man in another C file
* v 2.5  released
*  2.4.5 write-protect detected
*  2.4.3 option v to verify source only
*     multipass copies possible
*  2.4.2 all sects# outputted on any kind of error.
*        twister modified to accept starttrack parameter
*     track_map to know what to copy
*     t option to specify track
*     r takes options fvV
*  2.4.1 i for interactive: default no stop
*     V verify after format (case-sensitive options)
*     bug of verify reading into main buffer repaired
* v 2.4: Jan 15 88
*  2.3.2 If esc on insert abort
*     track_read first
*     no more skip opt
*     # of sect printed
*  2.3.1 Drive B presence is really tested
* v 2.3: Dec 28 87
*  2.2.3 comparisons were not done!!! -- repaired
*     copy by 3 sectors
*        stops if copy sector only by 1
*  2.2.2 bug de a1a1 repare
*  2.2.1 no verify by default
*     r for re-copy
* v 2.2: Dec 19 87
*  2.1.1 prints buffer size on start
*     sector_read done 4 times with comparison!
*     RETURN repeats last command
* v 2.1: Nov 28 87
*  2.0.1 retrys in writes and verify work now.
*     verify there is a drive B before copying
* v 2.0: Nov 22 87
*  1.6.3 verify is another pass
*  1.6.2 format does not verify anymore
*     format outputs a char
*  1.6.1 uses TWISTER's code mmtwst.c to format
* v 1.6: Nov 11 87
*  1.5.4 abort on ESC
*        option "2" for 2-sided.
*  1.5.3 abort on key with confirm
*  1.5.2 track, sectors begin at 1 instead of 0
*        retrys on writes retry format-write-verify loop
*     on write errors, ESC to go to another disk
```

```
 *  1.5.1 port to megamax
 *     uses all memory
 * v 1.5: more checking of entry syntax.
 *        on-line help
 *        fills bad sectors with 0s before writing
 *     more sensible memory allocation
 *     s option for auto skip
 * v 1.4: one automatic retry without prompting. If skips, copies good
 *     sectors anyway.
 * v 1.3: when error on a track, asks for retrys, which are done sector
 *        by sector.
 * v 1.2: when double sided, copy the two sides
 * v 1.1: whole side in memory for one drive use.
 * v 1.0: original one in mark williams. quick and really dirty.
 */

Flip is a small copier that I wrote for my personal use to:

- use the back of SS disks

- try to save data from damaged disks (getting frustrated with the abort
  message of DCFORMAT)

However, it evolved into (to my opinion) the BEST disk copier on the ST for
unprotected disks.
Since I and my friends are using it all the time, it might be of use to some
```

```
netlanders. As it was developed for my own use, it is not under GEM.
It is in no way as great a program as is GULAM or UNITERM

It is completly public domain, files are: (MEGAMAX C v1.1)

binaries:
     flip_26b.tos           the executable

sources:
     makefile
     flip.c        main code
     man.c         manual & history
     twst.c        formatter in in-line assembly, in fact TWISTER 2.0 code
               slightly modified (MEGAMAX v1.1)
               WORKS WITH ANY ROMS!

Archive-name: poplib

[This package allows you to add subroutine libraries that are external
 to the calling program, and independent of that program's language.
 Examples are provided; the author did not wish to release the source
 to his popup library, which is being posted to the binaries group. -sg]

XShared Library Support - Experimental
X-------------------------------------
X
XThe included files make up the pieces you need to create and use
Xshared libraries on the Atari ST.  Note that this is a experimental
Xversion.  I would like your feedback, especially constructive
Xcomments! :-)
X
XShared libraries are a useful way of factoring the common code out of
Xyour programs.  If you have a number of programs that use many of the
Xsame routines then you may want to use a shared library.
X
XIn this scheme, shared libraries are installed at boot time.  Each
Xlibrary maintains an array of pointers to it's externally accessible
Xentry points.  Programs that use a shared library acquire a pointer to
Xthe library's entry points.  An entry point is called by jumping
Xthrough the array.
X
XThe program LIBS.PRG (containing the basic shared library support)
Xshould be placed in your AUTO folder, followed by the shared libraries
Xthemselves.  An example library XLIB.PRG is included in this
Xdistribution.  At boot time GEM will execute LIBS.PRG, installing the
Xneeded shared libraries support.  As each library is executed it will
Xperform any needed initialization and install itself in memory.
X
XNote that the order of the files in the AUTO folder is critical.  The
Xprogram LIBS.PRG must preceed any libraries.  Also note that if a
Xlibrary is dependent on the presence of another library, then the
Xlibrary on which it depends must be installed first.
X
XOne of the interested possibilities offered by this scheme is the
Xability to easily make incremental changes to existing libraries to
```

```
Xwhich you may not have the source.  If there is a known bug in a
Xlibrary, you could come up with a 'patch' that replaces the offending
Xentry in the library's jump table with a pointer to your own routine.
X
XSupport routines
X----------------
X
X-- int InitLibSupport()
X
XCalled by any program using shared libraries to initialize the shared
Xlibrary support.  Returns 0 if the shared library support is NOT
Xinstalled.
X
X-- InstallLibrary(lib_link,keep)
X
XCalled by a library to install itself.
X
X-- Library FindLibrary(lib_name,lib_version)
X
XCalled by a program to find an installed library.  Returns 0 if the
Xlibrary is not found, or a pointer to the library's array of entry
Xpoints.
X
XThis distribution contains the following:
X
X    LIBS.H        - included by all code using shared libraries
X    LIBS.C        - terminate & stay resident library support
X    LIB_INIT.C    - module linked in by programs using libraries
X    LIB_INST.C    - module linked in by installable libraries
X
X    XLIB.H        - interface to example library
X    XLIB.C        - example library
X
X    XTEST.C       - program that uses example library
X
X    MAKEFILE  - to put all of the above together
X
XThis code was developed using Mark Williams C.

chmod 0600 README || echo "restore of README fails"
sed 's/^X//' << 'SHAR_EOF' > README.POP &&
XWhat is in this package ?
X
XThis posting contains a shared library for creating popup menus in all Atari-
Xprograms (not only GEM-Applications, but no accessories). It is based on the
Xshared library framework of Preston L. Bannister. He had an excellant idea.
XPlease read the original readme file from his distribution.
XThere is no easy way to use AES-Calls in a library started at boot-time. So i
Xchoosed the accessory form for this library. The popup.acc does not provide a
Xmenu-entry. It can only be called from inside of other programs.
X
X
XWhat is a popup menu ?
```

X
XIt is like an usual GEM-menu in the menu-bar except that it pops up wherever
Xthe mouse cursor is located when you call it. You can then select in the usual
Xway by clicking with the left mouse button when the desired item is highlighted.
XSubmenus are indicated by an arrow on the left side of the entry-text. If you
Xselect a submenu, it pops up at the current cursor location and the process of
Xselection is repeated. You can also cancel the actual menu level by clicking
Xthe right mouse button. If you press the Help-key you'll get some help on the
Xcurrent entry (or popup menus in general, if no entry is selected).
X
X
XHow can i use these menus ?
X
XYou can use them inside your own programs. Perhaps you should first look at the
Xexample source poptest.c . Normally you create a popup-menu by calling the
Xfunction DefineMenu("<menu-text>"), where <menu-text> is a list of entries, all
Xseperated by the pipe-symbol `|'. For more advanced formats you should look at
Xpopup.h, the interface documentation for popup.acc . As return value of the
Xfunction DoMenu(), which does the entire dialog, you get the number of the
Xselected entry.
X
X
XHow can i provide my own (help) functions ?
X
XThe format-specification in DefineMenu() is used like the C-function printf().
XTo specify a function to be called, when an entry is selected (the Help-key is
Xpressed), you can use the format %f (%h) and provide the function-address as
Xparameter to DefineMenu(). An example:
X
X```
X   beep()
X   {
X   putchar(7);
X   }
X
X   menu_selection()
X   {
X   menu my_menu;
X
X   my_menu = DefineMenu(" hello world ! %f",beep);
X   DoMenu(my_menu);
X   FreeMenu(my_menu);
X   }
```
X
XThe function is called with three parameters:
X    - the current GEM-handle of the virtual workstation of popup.acc
X    - the default return value of this item
X    - the string-entry of the current item
XIf you don't use AES-calls anywhere else in your program, you can use the
XFormAlert()-function to display GEM-alerts on the screen (with the usual
Xparameters of form_alert()). So you need not to link the whole GEM-stuff to
Xyour program.
X
XAny comments and suggestions are always welcome. Please mail to one of the
```

```
Xaddresses given in the popup.h file or when getting the generic-help message.

Archive-name: uupc/part01

This is the version of UUPC that I've been working on.  It allows you
to use your ST as a UUCP node.  Please look at the file "readme.1st"
before proceeding; it contains configuration instructions and some
caveats about the code.  It's about halfway through part03 if you
don't want to unshar before reading it.

#!/bin/sh

X
Xdescription
```

```
X
X    An 822 compatible (hopefully) mail delivery system for pc's.
X
X    Designed for delivering mail on a pc based system. It will put
X    local mail (ie, not @ or ! in address) into files in the default
X    mail directory.
X
X    If remote it will put into an outgoing mailbag in the default mail
X    directory. Performs a simple bundling of mail messages into one
X    file with arguments prepended as To: arg header lines. And adds a
X    Message-Lines: header which gives the number of lines in the
X    content part of the message (after the first blank line).
X
X         pcmail john jack jill@xyz.uucp < afile
X
X         To: john
X         To: jack
X         To: jill@xyz.uucp
X         X-Message-Lines: ?????
X         Content-Length: ?????
X
X         ...
X         ...
X         ...
X
X    Content-Length: is used without X- prepended to be compatible with AT&T
X    Mail bundles. This is not 822 compatible per se, but is allowed.
X
X    It also adds the from From and Date lines. Subject: lines may be inserted
X    by placing them at the beginning of the message.
X
X    A Unix version should lock the /usr/mail/mailbag file.
X
X    Another program called rpcmail will unbundle the files created by
X    pcmail and deliver each message to the local rmail. So conceptually
X
X         (pcmail ..... < ...; pcmail .... < ...) | sz -> rz | rpcmail
X
X    would deliver remote messages intact.
X
Xenvironment variables
X
X    The following evironment variables are used:
X
X         MAILBOX       current user's mailbox,     "stuart"
X         NAME     current user's name,        "Stuart Lynne"
X         DOMAIN        domain of this machine,     "slynne.mac.van-bc.can"
X         MAILDIR       where is mail kept,         "mpw:mail"
X
Xcompiling
X
X    Compiled by itself it will operate as a standalone program. If the
X    compiler option:
```

```
X
X        -DNOMAIN
X
X    is used, it will compile as a routine:
X
X        pcmail (argc, argv)
X        char **argv;
X        int argc;
X
X    and can be used internally in other programs.
X
X
XCustomization
X
X    PCMAIL        mailbag for remote mail
X    FAKEUUX       emulate uux, make appropriate files in SPOOLDIR
X
X    RMAIL         rmail
X
X    DEBUG1        first level Debug trace

XUUPC/ST version 0.1 "release" notes
X
X
X                              *** CAVEATS **
X
X        I'm releasing this very unfinished version of UUPC because I've
Xgotten so many requests for it.  I make no claims about the cleanliness
Xor functionality of this code; it is by no means debugged and is very
Xrough in a number of places.  In particular:
X
X- The program only works in originate mode, not answer mode.  This means
X  that your ST can poll other systems, but they can't poll you.
X
X- Newsfeeds are only minimally supported.  The program will take non-batched,
X  non-compressed articles as input to the "rnews" program and put them in a
X  spool directory, by default \usr\spool\rnews, with filenames indicating
X  the date and time that the articles were received.  No attempt is made to
X  sort articles by newsgroup.
X
X- The mail shell is primitive, to say the least.  I have improved on the
X  functionality of the shell in the original uupc distribution, but it
X  still lacks many features.
X
X- Configuration requires modification of a number of source files, which
X  will be listed later, and knowledge of some UUCP file formats (L.sys).
X
```

X	All of the above, and many more bugs and deficiencies, will be
Xfixed in the (near?) future. I stress again that I'm releasing this
Xsource code only because lots of people wanted to see it, not because I
Xthink it's anywhere near ready to distribute.
X
X	This code was developed with Laser C; it may or may not compile
Xor work under other systems.
X
X	I can't take credit for writing most of the code; read the other
Xdocumentation files for its history. I downloaded UUPC from uunet and
Xmodified it from there.
X
X
X
X			*** CONFIGURATION ***
X
X	Several files will have to be modified to configure the program
Xfor your site. If you can't get it working, too bad. That sounds harsh,
Xbut I have neither the time nor the inclination to answer 20 mail messages
Xa day about code that isn't finished yet. More complete documentation will
Xbe included with the final release of the code
X
XGENV.H Most of the items in this file should be self-explanatory; I
X	have included the defaults from my site.
X
XHOST.H The primary items of interest here are COPYFILE (which keeps a
X	copy of outgoing mail) and NEWSDIR, which is the directory to
X	stash news articles in. COPYFILE is relative to the home
X	directory specified in GENV.H.
X
XSYSTEMS This is UUPC's L.sys file; it lives in CONFDIR. I've included my
X	systems file, sans phone numbers and passwords (don't want to
X	upset my feeds!). Note that it differs somewhat from the standard
X	L.sys format; in particular, the "speed" field is the Hayes command
X	(without AT) to dial out to the target system.
X
X
X	I *think* those cover the configuration; the final release will
Xautomate configuration, maybe with a GEM shell (but I'm not promising
Xanything). I am also porting netnews 3.0 to the ST, so the final release
Xwill have a completely functional news system.
X	This code should be modified to run cleanly under MT C-shell;
Xit will hog CPU time like crazy as is. I plan to reorganize the code
Xto make porting to other environments easier.
X
X	If you have bug fixes or improvements, please mail them to me.
XI'd also like bug reports from people who get the system to compile, but
Xplease don't bother me with things like "it doesn't let you edit mail."
XSuggestions for new features will have to wait until I'm done with the
Xstuff *I* want to see -- I probably have 90% of the suggestions covered
Xalready. Questions about how to set up the program are subject to
Xdeletion without a reply; see the rationale above. Praise and offers
Xof wealth and power will be gladly accepted, however. :]

```
X        The code really isn't as bad as I've tried to make it sound; it
Xhas been working reliably for me for the past couple of weeks, and only
Xcrashes if the host you're connected to does something really weird.
X
X
X        -Steven Grimm
X         Domain: koreth@ssyx.ucsc.edu
X         UUCP:   ...!uunet!ucbvax!ucscc!ssyx!koreth
X                              or (faster):
X                ...!uunet!ssyx.ucsc.edu!koreth
X

Xuupc/dcp              June 8, 1987      Stuart Lynne
X
XFor Beta implementors only.
X
XThis is the very first release of my version of Richard H. Lambs uucp
Xprogram dcp.
X
XSee README.UUPC for overview of how everything is stitched together.
X
XSummary of Changes:
X
X    - eliminated references to all protocols except for the 3 window
X      g protocol
X    - streamlined dcp and condensed into four files
X    - moved host dependant stuff to one file uuXXX
X    - bug fixes to get 3w g protocol to send at full speed
X
X
Xdcp.c        - dcp pseudo main, high level stuff
Xdcp.h        - header file
Xdcpxfer.c    - file xfer
Xdcpsys.c - connection stuff
Xdcpgpkt.c    - g packet protocol
X

X        604-937-7532
X
X
XFixes
X
XJun 8/87 Added FOPEN and CREAT to recursively create directory
X             trees if they don't exist when a file is opened for writing
X             or appending
X
XJun 8/87 Found bug in getting file name in initial protocol sequence
X             Need to read more than one packet.
```

```
X
XJul/87       Added Hayes dialer to dcpsys
SHAR_EOF
chmod 0600 readme.dcp || echo "restore of readme.dcp fails"
sed 's/^X//' << 'SHAR_EOF' > readme.inf &&
XAugust 9, 1987    uupc Questions and Answers     uupc Development
X
X
XThe following is some commonly asked questions about uupc and, of
Xcourse, the answers to these questions.
X
X
X 1. What does "uupc" stands for?
X
X    It is an acronym for "UUcp for PC's", but it is also a pun on
X    uucp, which is in turn an acronym for "Unix to Unix CoPy".
X
X 2. What does uupc do?
X
X    It gives a personal computer the capability to become a
X    "node" in the UUCP (or a similar) network and exchange
X    information such as electronic mail and USENET news with
X    other computers on that network.
X
X 3. What personal computers does uupc runs on?
X
X    Currently it is available for the Apple Macintosh, Atari ST,
X    Commodore Amiga, and IBM PC (and compatibles) with DOS.  More
X    computers and operating systems will be able run uupc in the
X    near future.  (IBM PC with MINIX is a likely next candidate.)
X
X 4. Does uupc require me to leave my computer on all day to wait
X    for incoming mail?
X
X    No.  Most people only use uupc to call up their neighbouring
X    system to send and/or pickup mail at times convenient to
X    them.  Outgoing mail are also spooled to disk and do not need
X    to be send immediately to your neighbouring system after it
X    is composed.
X
X    However, uupc can also be set up on a personal computer to
X    wait for incoming call continuously and act as a "mail-hub"
X    to relay messages for other systems if you choose.
X
X 5. What do I need to have to get uupc up and running on one of
X    the above personal computers?
X
X    You need a neighbouring system to communicate with.  This
X    system can be either a UNIX system, another personal computer
X    running uupc, or any other system that can talk UUCP's 'g'
X    protocol.
X
X    You would also need to have the appropriate C compiler for
```

X   your personal computer if you have received only the source
X   for uupc.
X
X 6. Is the source to uupc publicly available?
X
X   Yes. It was posted to the USENET newsgroup comp.sources.misc
X   in August 1987 and is available from (at least) any site
X   which archives this newsgroup. If you have trouble locating
X   a copy of the uupc sources, please drop uupc Development a
X   note through one of the e-mail addresses listed at the end of
X   this file.
X
X 7. What does the uupc software consists of?
X
X   It consists of two programs, uupc and pcmail. uupc is an automated
X   files transfer program, similar to /usr/lib/uucico in UUCP,
X   and mail is a mailer user-interface, like mail(1) in UNIX.
X
X 8. What are the typical use of these programs?
X
X   uu is used to accept incoming file relayed to you through
X   your neighbouring machine and deliver outgoing file to your
X   neighbouring machine for forwarding to other machines. In
X   most cases these "files" contain electronic messages which
X   are to be used with the mail program.
X
X   pcmail is used to read incoming mail delivered by uu, and
X   compose outgoing mail for delivery with uu. However, it can
X   also be used to transfer files to/from other systems that is
X   reachable through electronic mail.
X
X 9. What do I need to do to get uupc running on my personal
X   computer?
X
X   You would need to obtain the binaries of uupc for your
X   computer by either compiling the uupc sources on your machine
X   or obtaining the uupc binaries from someone who has a copy.
X
X   You would also need to arrange to have your neighbouring
X   system to recognize your system as one of their neighbouring
X   systems in the network. The procedures for this varies, you
X   should contact the people who manage your neighbouring system
X   for about details.
X
X10. Does uupc supports more than one neighbouring systems?
X
X   Yes, it can support multiple neighbouring systems. The mail
X   software will currently always route outgoing mail through
X   one of these systems, but a future version of this software
X   will allow multiple forwarding machines for outgoing mail.
X
X11. Is uupc the same program on all systems it runs on, or is it
X   actually a different program for each of the systems?

X
X   It is the same program across all systems, with the exception
X   of the system-dependent code, which is different from system
X   to system.
X
X   The user-interface and command line options for uupc are also
X   uniform across all the systems it runs on, so there is no
X   need to learn a new program when you use uupc on a different
X   computer. The uniform user-interface also makes it easier to
X   use uupc on different computers at the same time.
X
X12. If I don't like the mail program's simple user-interface, are
X   there any alternatives?
X
X   Since a mailbox can be easily converted to a simple text
X   file, alternative mailer can be easily written to accomodate
X   different needs. At the very least, you will be able to use
X   your favorite text-editor to read your incoming message and
X   compose your outgoing message.
X
X   Future release of uupc will include mailers for the different
X   systems which will take advantage of special features only
X   availabe on the systems they run on (e.g. window and mouse).
X
X13. What if I want to port uupc to another personal computer not
X   presently support by uupc?
X
X   First you should read the file UUPORT.INF, which should be
X   available from the same source you obtained this file from.
X   If you cannot locate a copy of this file, then please send a
X   request for it to uucp Development at one of the e-mail
X   addresses listed at the end of this file.
X
X   After you have read the above file and decided that you still
X   want to do a port of uupc to a new machine/operating systems,
X   please drop uupc Development a note at one of the the e-mail
X   addresses listed at the end of this file. This way we will
X   at least be able to save each other from duplicated efforts.
X   Who knows? We might even have a version for ready for your
X   system when you call to tell us that you are about to begin
X   your port.
X
X14. Who/what is the "UUPC Development Team"?
X
X   The original software (dcp) was done by Richard H. Lamb.
X   Modified to run on the Mac by Stuart Lynne.
X   Atari ST by Lawrence Harris.
X   Amiga by Jeff Lydiatt.
X   IBM PC by Samual Lam
X   VMS (not available yet) Lawrence Harris
X
X15. What is the copyright status and distribution policy of uupc?
X

X   The dcp portions of uupc are Copyright (c) Richard H. Lamb.
X   Modifications Copyright (c) Stuart Lynne
X   Mail, PCMail Copyright (c) Stuart Lynne
X   Mac software Copyright (c) Stuart Lynne
X   Amiga software Copyright (c) Jeff Lydiatt
X   Atari software Copyright (c) Lawrence Harris
X   IBM software Copyright (c) Sam Lam
X
XIn general we are promoting the use of this software on a "public domain"
Xbasis. You can use for your own use, and can give copies of the source
Xcode to anyone, provided you provide this information to them.
X
X
X16. If I have more questions, comments, or suggestions about
X   uupc, where should I send them?
X
X   Please send them all to us at uupc Development at one of the
X   e-mail addresses listed below. We also welcome any bug fixes
X   and improved/new code for uupc that you might want to share.
X
X
Xuupc Development can be reached at the following e-mail address:
X
X   uupc@van-bc.UUCP
X
XThis is routed to the uupc mailing list and a local news group for
Xdiscussion of uupc software.
X
XTo join the mailing list send a request to:
X
X   uupc-request@van-bvc.uucp
X
X
X
X17. Can I get Binary Versions of uupc mailed to me.
X
XYes and no.
X
XNo we cannot email binaries to you at this time.
X
XYes, if you send a self addressed / stamped (international coupon) mailer
Xwith appropriate diskettes (2) we will attempt to return them to you with
Xthe appropriate version of the software.
X
XWe plan to make a binary posting to the appropriate Usenet comp.binary
Xnewsgroups in the late fall, or early next year when the software is
Xa bit more functional, better documented and easier to install and
Xoperate without the source.
X
XMail your disks to:

Xuupc Porting Information     August 3, 1987      uupc Development
X
X
XThis writeup is aimed at programmers intending to port uupc to
Xmachines and operating systems which it don't currently run on.
XIf you only want to install uupc on a system where a uupc port
Xexists, this writeup might also provide some insights to the
Xinternal working of uupc and make the installation of uupc on
Xyour machine a more interesting task.
X
XSince I did part of the IBM-PC/MS-DOS port for uupc, what I will
Xdescribe here is actually closely related to the structure of
Xthis particular port.  (I also did part of the port of uupc's
Xmailer to AIX (SVR1) on the RT-PC.)  What is shown here is *by no
Xmean* the only way things could be done, it's just some tips and
Xhints that I can think of after doing one-and-a-half port of
Xuupc.
X
XThe purpose of this writeup is to try to make the life of
Xprogrammers doing uupc ports for other machines/operating systems
Xeasier.  However, the best sources of information on how new
Xports should be done is still by reading the system-dependent
Xcode of the existing uupc ports.  (This is how I learnt how to do
Xmy ports.)  It would also be useful to have a listing of the
Xsystem-dependent code of the IBM-PC/DOS port handy while reading
Xthis writeup.
X
X
XTo compile uupc, the C compiler and linker on your system must be
Xable to differentiate between upper and lower cases in external
Xnames.
X
XThe C run-time support on your system should use '\n' as line
Xseparator for *text* files.  If your system uses other sequences
Xor methods to delimit text file lines, the C run-time support
Xmust perform the appropriate translation functions for mapping in
Xboth directions when a file is opened in text mode.
X
XIn order to port uupc to a new machine/operating system, you have
Xto come up with a new version of six system-dependent files in
Xthe the "local" directory.  The names of these six files in the
Xlocal directory are host.h, host.c, mlib.c, ulib.c, ndir.h and
```

```
Xndir.c.
X
XNote that theses files could in turn #include other *.c and *.h
Xfiles if you wish to separate the system-dependent code into more
Xsmall files.  The important thing here is that they must
Xcollectively provide the same set of routines, global variables,
Xand environment to the common code.
X
XWhat should be contained in these six files are describe below:
X
X
Xhost.h - Host dependent file virtual #included everywhere else.
X
X   Almost every file in both the common and host-dependent code
X   include this header file.  So it should contains all the
X   #includes, #defines, and externs that everybody would need.
X
X   Parts of the uupc common code assume Berkeley-style index()
X   and rindex(), so if your system supports only SysV-style
X   strchr() and strrchr(), they need to mapped using #define
X   here.
X
X   Declarations for "library" routines in host.c, mlib.c and
X   ulib.c should also be make here to made them known to the rest
X   of the world.  However, declaractions for the directory
X   scanning routines should be put into ndir.h instead.
X
X   If your system requires that text file and binary fiies be
X   opened differently, you should map the name 'FILEMODE' into
X   'filemode' with a #define here.  Otherwise, 'FILEMODE' should
X   be mapped to the null string.
X
X
Xhost.c - Generic main program and library routines for both parts.
X
X   This file includes a generic main program that simply starts
X   up and call the procedure MAIN.  More importantly, the
X   definition of all the library routines that are needed by both
SHAR_EOF

  else exit 0; fi
) < s2_seq_.tmp || exit 1
sed 's/^X//' << 'SHAR_EOF' >> readme.por
X   uu and mail are also here.
X
X   This generic main program is used to start up both uu and
X   mail, by having the preprocessor symbol MAIN #defined to
X   different procedure names in the files which include host.c.
X   This generic main program should perform all the necessary
X   start up and wrap up functions as required by the host
X   operating system and call the routine MAIN while the host
X   environment is established.
X
X   If the preprocessor symbol CWDSPOOL is #defined by the file
X   that #includes host.c, the main program should change the
X   current working directory to the spooling directory before
X   calling MAIN, and switch back to the orginal directory after
X   MAIN had returned.
X
X   The following are the other routines residing in host.c and
X   used by the others parts of both uu and mail:
X
X   importpath - A deterministic function which maps a canonical
X      file name to a local file name.  This function must be
X      deterministic (i.e. always return the same local name when
X      given the same canonical name) because it is used on each
X      canonical file name several times in various part of the
X      code to obtain the corresponding local file name.
```

```
X
X      A canonical file name has the same format as a UNIX
X      pathname, and the format of a local file name is defined by
X      your local file system.
X
X      This function should at least preserve the first 6 and last
X      2 characters of the canonical file name, since this parts
X      of the canonical file name usually contain the site name
X      and the sequence number, which is critical to the
X      successful operation of uupc.
X
X      Perferably the last 4 characters of the canonical file name
X      should be perserved, since that is the number of digits in
X      the sequence number, but if that is not possible, an
X      attempt should be made to preverse the last 3 characters
X      before resorting to only preserve the last 2 characters.
X      (With only the last 2 characters preserved, the spool file
X      sequence number cycle will become only 100 before it goes
X      around again.)
X
X   mkfilename - Build a local path name out of a given local
X      directory path and local base name pair.  It usually just
X      concatenates the two parts together with the local system's
X      directory path separator between them.
X
X   loadenv - Retrieve certain configuration parameters from the
X      user's "environment" and make them available to the
X      program.  This involves filling in the appropriate global
X      (char *) variables to point to the appropriate strings
X      which contains the character value of the desired
X      configuration parameters.
X
X   If your system requires the differentiation of text file and
X   binary files, you should also supply the following routine.
X
X   filemode() - If this routine is passed the character 't' as
X      parameter, any subsequently opened file in the program
X      should be opened in text mode.  Similarly, if the parameter
X      is the character 'b', all subsequently opened file should
X      be opened in binary mode.
X
X
Xmlib.c - Library of routines used only by the mail part.
X
X   Currently there is only one routine in this library.
X
X   get_one - Wait for a single character to be typed on the
X      console keyboard and return to the caller with the
X      character read as soon as it is pressed.  It short, this is
X      a routine that detects and returns a keypress.
X
X      This routine is used when you reach the bottom of a page
X      while paging through your mail.
```

```
X
X      The single character read by this routine should not be
X      echoed to the console screen.
X
X
Xulib.c - Library of routines used only by the uu part.
X
X   login - The logger which verifies logins and passwords for
X      incoming UUCP connections.  You only need to have this
X      routine functional if you plan to ever run your node in
X      slave mode.  i.e. Waiting on the phone line for other nodes
X      to call you to make UUCP connections.
X
X   shell - Perform an UNIX command sent from a remote site via
X      uux.  To support incoming remote mail you need to emulate
X      the UNIX 'rmail' command, which can be easily done using
X      the pcmail package (compiled as rmail) which is part of
X      this uupc distribution.  If you want to also support
X      incoming USENET news-feeds, the UNIX 'rnews' command will
X      need to be supported as well.
X
X      If your system is capable of invoking another program
X      within a program, you might want to dispatch rmail and
X      rnews as a separate program here.  Otherwise, you might
X      need to compile, or link, them into uu as routines.
X
X   sleep - Wait a specified number of seconds in real-time.  You
X      could either use a busy wait loop or a timer alarm here,
X      depending on if your system has other (e.g. background)
X      jobs competing for CPU time at the same time.  On mutli-
X      tasking or multi-users systems, you would likely *not* want
X      to busy wait even if that's easier to implement.
X
X   The rest of this library consists of routines to deal with the
X   communications line (serial port).
X
X   openline - Open a communications line as the active line.  The
X      name of the serial line device and the speed to open the
X      line at are *both* specified as (char *) type parameters.
X      These value are just the corresponding values in the
X      systems file entry of the site being called.
X
X   sread - Read a specified number of bytes from the active
X      serial line and return with *no* input characters consumed
X      *if* the specified number of bytes is not available after
X      the specified timeout period.  This is basically a non-
X      blocking read that waits up to an user-specified amount of
X      time before returning.
X
X   swrite - Write a specified number of bytes out to the active
X      serial line.  No timeout mechanism needs to be provided by
X      this routine.
X
```

```
X   closeline - Close the active communications line.
X
X   SIOSpeed - Change the line speed of the active communications
X      line on-the-fly.  The new line speed is given as (char *)
X      rather than (int).  Note the mixed-case nature of this
X      routine name.
X
X
Xndir.h - Header file for the directory scanning routines.
X
X   At least the following needs to be defined in this file.
X
X   -- The constant 'MAXNAMLEN' declared with "#define".  This is
X      the maximum length of a file name in your system.  Note
X      that a file name does not include a directory path prefix,
X      it is only the maximum length of a file name within a
X      directory.
X
X   -- The structure 'direct' declared with "struct".  This
X      structure is a public data structure and its fields are
X      examined directly by uu, so your declaration needs to
X      provide at least the following fields:
X
X      struct direct {
X         short d_reclen;
X         short d_namlen;
X         char  d_name[MAXNAMLEN + 1];
X      };
X
X      d_reclen is the length of the structure minus the size of
X      the unused portion of d_name at the end of the structure.
X
X      d_namelen is strlen(d_name).
X
X      d_name is the name of the next file in the scan, with a
X      terminating '\0'.
X
X      It is important for the structure 'direct' to be defined
X      using "struct" insted of "typedef".
X
X   -- The type 'DIR' declared with "typedef".  This is a private
X      structure used by the ndir routines and should contain all
X      the static data related to a single invocation of the ndir
X      routines.
X
X      It is important for 'DIR' to be defined using "typedef"
X      instead of "struct".  (Note this is the *reverse* of the
X      structure 'direct' above.)
X
X   -- The routines opendir(), readdir(), and closedir().  Which
X      opens a specified directory, read the next file entry from
X      an opened directory, and close an opened directory,
X      respectively.
```

```
X
X
Xndir.c - "Berkeley-style" directory scanning routines.
X
X   This file contains a set of routines similar in functions to
X   the Berkeley-style directory scanning routines.  These
X   routines are used only by uu, not mail, and only the
X   opendir(), readdir(), and closedir() routines are used, and
X   therefore need to be implemented.
X
X   Eventhough the ndir routines should be capable of mutliple
X   concurrent invocations using separate (DIR *)'s, uu only uses
X   one invocation of it at a time.
X
X   If your system's file name is mono-case, then your readdir()
X   routine should always return the file name field (d_name) in
X   all lowercase.
X
X
XAny questions about porting uupc to other machines/operating
Xsystems, and comments and suggestions about this writeup should
Xbe directed to one of the e-mail addresses listed at the end of
Xthis file.
X
XIf you do decide to start porting uupc to a new machine/operating
Xsystem, please drop us a line as well.  We might even be able to
Xsave each other some duplicated efforts!

SHAR_EOF
chmod 0600 readme.por || echo "restore of readme.por fails"
sed 's/^X//' << 'SHAR_EOF' > readme.st &&
XThis file contains the Atari ST specific files.
X
XI have done all the compilation using the Alcyon C versin 4.14a compiler.
XThe disks were layed out with all the sources and objects on the A drive and
Xthe compiler on the D drive.
X
XProblems with the Atari ST code:
X
X    - there is a problem in the getsystem(), sysend() states such that
X      if there is more than one system in the systems file then the
X      program may bomb bomb (bus error?)
X
XFiles included in this shar script:
```

```
X
X        On the atari these files should be placed in the
X        \local directory or the .h files will need to be
X        edited.
X
X      dirsubs.c   - file and directory name manipulation
X      dmymath.c   - dummy floating point routines to fake out linker
X      genv.c  - load enviroment strings
X      getenv.c    - get and enviroment string
X      getone.c    - get one character without echo
X      host.c  - host specific main program
X      inoutpth.c  - file name conversion
X      ndir.c  - directory manipulation routines
X      printmsg.c  - print message to log file
X      time.c  - date/time conversion routines
X      uusup.c - uu support routines
X
X      The following files belong in the ./local dirctory and should
X      be moved there with the leading z stripped off.
X
X      zdcp.h  - main include file for uu
X          zmailhost.c  - host specific mail main program
X          zuuhost.c    - host specific uu main program
X      zgenv.h - definitions for enviroment variables
X      zhost.h - host specific definitions
X      zndir.h - directory manipulation routines header
X      ztime.h - time routine header
X
XThe following script files are included as examples on how to compile
Xthe sources.  They are for the CM command shell.
X
X      c.mm        - compile script for alcyon C (file is in A:\)
X      cu.mm       - compile script for alcyon C (file is in A:\atari\)
X      env.mm  - define enviroment script
X      ldcp.mm - link uu.prg
X      lmail.mm    - link mail.prg
X      uuar.mm - create DCPLIB
X      utar.mm - create UTLLIB
X
XBasic procedure is to:
X    - compile all the .c files into .o files
X    - build the DCPLIB with uuar.mm
X    - build the UTLLIB with utar.mm
X    - link uu with ldcp.mm
X    - link mail with lmail.mm
X
XIf you have problems feel free to drop me a line.  Though I warn you I have
Xa slow turn around time on questions I will try to get back to you within
Xa day or two.

SHAR_EOF
chmod 0600 readme.st || echo "restore of readme.st fails"
sed 's/^X//' << 'SHAR_EOF' > readme.uup &&
XJuly 29/87                          Stuart Lynne
X
XUUPC is now running on Macintosh, Atari-ST, Amiga, and IBM-PC with MS-DOS.
X
XThese versions will constitute my first release of uupc and pcmail. Please
Xsee the README files in each shar file for appropriate instructions.
X
XAs is, uupc sends and receives files quite well. Still unimplemented is
Xthe reverse direction file transfers, i.e. send a file to a remote host
Xwhile in slave mode, receive a file while in master mode. These are not
Xneeded to support news and mail. A proper uucp command is need too.
X
XThe user agent mail program is a very simple hack to simply allow you to
Xread and send mail. Hopefully someone will work on replacing this!
X
XThe message transfer agent pcmail program is fairly robust. It does need to
Xhave some more intelligence to allow for more intelligent routing of outgoing
Xmail. Currently ALL outgoing mail is forward to a single remote site for
Xprocessing. This will actually handle the needs of a large number of users
Xbut for those lucky ones who can actually get access to several large uucp
Xsites better routine would be nice.
X
X
XOther things which are needed:
X
X    news unbatcher
X    news reader
X
XCurrently the news is simply spooled to a directory with a unique file name.
XYou can read this with a normal text editor. If you wish to have outgoing mail
Xthe easiest way is to have your news feed set up alias's like:
X
X    comp.sys.amiga "| /usr/local/lib/news/recnews comp.sys.amiga"
X
XThen simply mail your article to:
X
X    comp.sys.amiga@newsfeedhost.uucp
X
X
XPlease feel free to port this code to other environments. I ask only that you
Xtry and limit changes to the machine independent code. Things have been setup
Xso that you shouldn't have to modify dcp, uupc, mail or pcmail if you are simply
Xporting to a new environment.
X
XPlease send me any new versions, diff's to get old versions working better,
Xbug fixes etc.
X
XHave fun and enjoy.
```

```
X
XI would suggest that questions and comments about uupc/dcp/mail be directed
Xto comp.mail.uucp on Usenet. This group is about "Mail in the uucp network
Xenvironment." which describes uupc pretty well.

X
XNB. Rurrently UUNET is only polled twice per week, you may wish to send
Xany messages via both paths to ensure delivery. UUNET is probably more
Xreliable, ubc-vision may be faster if you can reach them from your site.
X
X
X
Xuupc              June 8, 1987       Stuart Lynne
X
XFor Beta implementors only.
X
Xuupc incorporates a streamlined version of dcp to implement a uucp mail
Xand news delivery system.
```

```
X
XSee README.DCP for dcp info.
X
XBy moving the host dependant code into one file the other four dcp files can
Xhopefully be maintained easily. It should be possible to maintain one version
Xof them which compiles and runs on all machines without conditional compilation
Xflags.
X
XThe host file should contain:
X
X    - serial I/O
X    - BSD compatible directory routines
X    - system call stuff
X
XThis all goes to implement a command called uupc. It is similiar to the uucico
Xcommand under unix.
X
X    uupc [-xn] [-shost]
X
X
XThere is also two mail source files. Pcmail is the MTA part of the mail system.
XIt compiles in two ways, one for rmail (add only From and Received: headers),
Xdefine a simple rnews; and for lmail (add all headers). Pcmail will effect
Xdelivery of mail to local and remote users. Currently all remote mail is
Xdirected to one smart host for forwarding.
X
XMail is a simple UA. It allows you to send mail and read your mailbox. It needs
Xlots of work but is servicable.
X
X    mail -s "subject here" user user@remote.site.domain < message
X
X    mail -f =mailbox
X
X    mail
X
Xwill all do the obvious. Mail will append a .signature if it can find one, and
Xwill keep a copy of your outgoing mail in =mail.sent.
X
XToDo:
X
X    uucp command
X    mail improvements
X    bug fixes to uupc/dcp
X    ports to Atari, Amiga, IBM PC, VMS
X
X
XMakefile - sample Makefile (Macintosh Aztec C)
Xgetargs.c    - library routine
Xlmail.c  - define LMAIL; include pcmail
Xmail.c   - mail program (UA)
Xpcmail.c     - mail program (MTA)
Xrmail.c  - define RMAIL; include pcmail
Xlib.c        - misc library routines, FOPEN, CREAT, getargs, printmsg
```

```
X
Xhost.h       - prototype for host.c, includes "local/host.h"
Xmailhost.c   - ditto for mailhost.c, includes "local/host.c"
Xmlib.c       - ditto for mlib.c,    includes "local/mlib.c"
Xulib.c       - ditto for ulib.c,    includes "local/ulib.c"
Xuuhost.c     - ditto for uuhost.c,  includes "local/host.c"
X
X
Xpcmail in general
XPcmail provides MTA functionality. It delivers the mail. Currently it is
Xvery dumb about forwarding mail. Local deliveries always succeed if there
Xis room and the mail spooling directory exists. No "/etc/passwd" file list
Xof users is used to determine if there really is a mailbox for an incoming
Xmessage. Also outgoing mail is assumed to go to one smart host for
Xprocessing. This is determined by scanning for "!" or "@" in the address.
X
XBoth local and remote delivery algorithms could be souped up. Locally we
Xshould maintain a list of mailboxes. For remote we should attempt to build
Xa path to the most reasonable host for forwarding a specific message. This
Xwill require a small version of the paths database most likely. If your
Xonly talking to one host anyway the current scheme is not all that bad.
X
XPcmail has one additional capability which is not currently being exploited.
XIt can add additional message length header lines and spool mail into a
Xmailbag. This mailbag could then be sent intact to your host for processing.
XThe host must run rpcmail (availble from sl@van-bc.uucp) to unbatch the
Xmessages to rmail. This corresponds to the AT&T Mail protocol for uploading
Xmail from PC's.
X
XMost likely the converse capability would be more suitable. Have the host
Xbatch incoming mail and news. Unbatch it on this side.
X
Xpcmail / LMAiL
XThe mail UA is composed of the mail.c program and pcmail.c compiled without
Xdefining RMAIL (LMAIL). The LMAIL version of pcmail adds rfc822 headers
Xto all mail, copies mail to =mail.sent etc.
X
Xpcmail / RMAIL
XThe uu program contains the RMAIL version of pcmail. It only adds the From
XReceived: headers to incoming mail.

X
XSystems File
X
XNB. I have split the lines, in the real file they should be one line for
Xeach entry.
X
XThis entry uses the built in Hayes dialer.
X
Xvan-bc Any a HAYES TD939-4782 g ogin:--ogin: uuslmac sword:-\c-sword: uuslmac
X
X    Connect to van-bc using HAYES dialer with phone number 939-4782 with
X    protocol g.
X    Wait for ogin: if timeout send \n and wait for ogin:.
X    Send uuslmac (login ID).
X    Wait for sword:, if timeout send nothing, wait for sword:
X    Send uuslamc (login ID).
X
XI use this entry to connect via a DC Hayes Smartmodem 2400, dialing explicity.
X
Xvan-bc Any a DIR 2400 g "" ATZ OK-\d+++\dATZ-OK ATS7=12 OK ATTD939-4782
X    CONNECT \d\c ogin:--ogin: uuslmac sword:-\c-sword: uuslmac
X
X    Connect to van-bc at 2400 on port a with protocol g.
X    Expect nothing, send ATZ to reset the modem,
X    Expect OK, if not received send pause +++ pause to try and get
X    modems attention and wait for OK.
X    When OK received, send ATS7=12 to shorten connect timeout on modem.
X    Expect OK, send ATTD939-74782.
X    Expect CONNECT, send nothing but pause (\c is needed).
X    Expect ogin:, if not received send newline.
X    Send login name.
X    Expect sword:, send password.
X
X
```

```
XThis entry is used to connect directly to my Callan at 9600. It is
Xcomplicated due to the Callan running a special mgetty program which
Xthinks it is talking to a Hayes Smartmodem. So we fake it out, then
Xtell it the connection has been made at 9600, then switch to 9600
Xourselves.
X
Xvan-bc Any a DIR 2400 g "" OK\r\d\dRING\r\dCONNECT\s9600\d\z9600\
X    ogin:-\r\r-ogin: uuslmac sword:-\c-sword: uuslmac "" \d\d\d\d\d\d\c
X
X    Connect to van-bc at 2400 on port a.
X    Expect nothing, send OK, pause, RING, CONNECT, 9600,
X    and change to 9600 bps.
X    Expect ogin: send login id.
X    Expect sword: send password.

Archive-name: gnufp

[This will probably require some tweaking before it will compile on the
 ST. At best, you'll have to adapt gcc's inline assembly to whatever
 your compiler uses. -sg]

Due to popular demand, here is gnulib.c, a set of floating point routines
for the 68000 and 68020.

```
/* Subroutines needed by GCC output code for the 68000/20.

   Compile using -O flag with gcc.
   Use the -m68000 flag if you have a 68000

   This package includes 32 bit integer and 64-bit floating
   point routines.

   WARNING: alpha-test version (July 1988) -- probably full of bugs.
   If you find a bug, send bugs reports to jsm@phoenix.princeton.edu,
   or

        Scott McCauley
        PPPL P. O. Box 451
        Princeton NJ 08543

   Known bugs/features:

   1) Depending on the version of GCC, this may produce a lot of
      warnings about conversion clashes, etc. It should still compile
      as is. Also, there appears to be a bug in the register-allocation
      parts of gcc that makes the compiler sometimes core dump
      or run into an infinite loop. This version works -- if you
      decide to change routines these compiler bugs can bite very hard....

   2) all single-precision gets converted to double precision in the
      math routines (in accordance with K&R), so doing things in
      double precision is faster than single precision....
```

```
   3) double precision floating point division may not be accurate to
      the last four or so bits. Most other routines round to the
      lsb.

   4) no support of NaN and Inf

   5) beware of undefined operations: i.e. a float to integer conversion
      when the float is larger than MAXIINT.

Posting-number: Volume 1, Issue 71
Archive-name: break

The following program, when placed in the AUTO folder or started by hand,
lets you interrupt any program (except the desktop).
The corresponding binary is sent to the moderator of comp.binaries.atari.st.
The program was assembled and linked with the assembler and linker from the
GST-C compiler.

For correspondence conceirning this program (bugs, questions etc.) try

*                                                                           *
*****************************************************************************
*
* NAME
*    break - stop current program on receipt of interrupt character
*
* SYNTAX
*    break [-e|-d|-z] [-i|-c<code>]
*
* DESCRIPTION
*
*    After installing break, any program can be interrupted.
*    This is achieved by 'extending' the existing keyboard interrupt
*    routine: after executing the old code the break character check
*    is done.
```

```
*
*    The various flags have the following meaning:
*       e(nable) : the current break character will end the program.
*                  the code returned is -32, what seems to be the standard
*                  value for programs interrupted by ^C in GEMDOS.
*       d(isable): no actions are done; this restores the old behaviour
*       z(ero)   : the current break character will be discarded (made 0)
*                  in the input buffer; this can be used to disable ^C.
*       i(nput)  : the break character is prompted for. Combinations with
*                  shift, control and alternate keys are also allowed.
*                  Useful for specifying the break character interactively.
*       c(ode)   : specifies the break character as a hexadecimal code.
*                  The hex code must follow the 'c' flag immediately.
*                  Useful for specifying the break character from a script.
*    Of the flags e,d and z only one should be used; e is the default.
*    Also, of the flags i and c only one should be used; control-delete is
*    the default. This is done on purpose; you can always change it to ^C
*    if you want to (or whatever key you like).
*
*    The break program can be reused indefinitely, because a next invocation
*    is not made memory resident; it only modifies parameters in the first
*    invocation (the resident one).
*
*    The program can be placed into the \AUTO folder to be installed
*    automatically, or activated 'by hand'. If placed in the \AUTO folder, it
*    should of course have a .PRG extension (break.prg); as \AUTO folder
*    programs don't get arguments, the break will be enabled and the break
*    character is control-delete in this case.
*
* BUGS/SHORTCOMINGS
*    A nice extension would be the possibility to catch the interrupt from
*    a user program; this could be achieved by using a new trap. As this
*    implies restoring the old interrupt catch routine when the program
*    exits, and maybe also core dumps could be added to the action of an
*    (other) interrupt character, such a more general signal mechanism is
*    not added (yet). Gives me time to think of a nice implementation 8-).
*
* JOKE
*    Gimme a break, huh?!

[This is a new version of Leo de Wit's "break" program, recently posted.
 It avoids the use of undocumented locations, so should be compatible with
 all versions of TOS. -sg]

Here is the source to your break.s, as modified by me. There is no
command line option to change the default hard-break key -- I'm just
lazy, I guess.

```

Archive-name: timecode

The following program, timecode, is mainly meant for the programmer crowd.
It lets you time a series of 68000 instructions (entered as short hex numbers)
which of course should constitute valid (and sensible) code; the result is
displayed as a number of clock ticks.

The corresponding uuencoded binary and a manual page have been sent to
the moderator of comp.binaries.atari.st.
Compiled with the Lattice C compiler; I used a different startup.bin to
obtain a smaller program (not included).

For correspondence conceirning this program (bugs, questions etc.) try

 *****************************************************************************
 *
 * NAME
 *    timecode - time execution of MC68000 code
 *
 * SYNTAX
 *    timecode [-repeat] <shorthex1> <shorthex2> ...
 *
 * DESCRIPTION
 *    Timecode times the time needed to execute a series of MC68K instructions.
 *    The time taken is expressed in clock ticks.
 *    The repeat flag is optional; it is a number indicating how many times
 *    the series will be repeated (default 100000) so that timing can be
 *    accurate; a lower repeat count will fasten the execution but leads to
 *    less accuracy.
 *
 *    One of the advantages of timecode is that timings can be calculated
 *    online.
 *
 * RESTRICTIONS
 *    1) Up to 32 codes can be timed at once. This is generally no objection,
 *       since most of the time one times only one instruction at a time.
 *    2) When using opcodes that read from or write to memory the pointers
 *       used will have to be prepared correctly. A convenient way is to
```

```
 *       time the instruction to load the address register, then time both
 *       the address register load and the instruction that references
 *       memory via that pointer. Subtract the first from the second to
 *       obtain the actual number of ticks for the 'mem-ref' instruction.
 *       This whole story applies to whatever code needs proper
 *       initialization. A safe place for memory references is the screen
 *       memory.
 *    3) Take care when using branches and stuff like jsr, rts etc.
 *       Your code should handle that one way or another.
 *    4) All registers may be used except the stack pointer. SP may be
 *       used if it restored also. The items currently on the stack must
 *       be left undisturbed; if you need to access (SP), first lower SP,
 *       and increment it afterwards.
 */

/*
 *    DERIVATION OF TIMING FORMULA.
 *
 *    The formula used for the calculation of the number of ticks is
 *    (using integer division):
 *       ticks = (7791*total + (repeat / 2))/repeat - 32;
 *    where
 *       ticks : # of ticks one execution of the series takes
 *       total : # of milliseconds the complete test takes
 *       repeat: # of repetitions of the series
 *
 *    This has been derived as follows:
 *       total # of effective ticks for the test =
 *       (total - call) * eff * 8000 =
 *       repeat * (ticks + extra)
 *    where
 *       call  : # of milliseconds lost by calling the test function
 *               and saving registers. This is negligable.
 *       eff   : a coefficient (max. 1) that indicates how many ticks of
 *               the processor are really used - the others are lost in
 *               interrupt handling. Measuring gave 0.9739 as value; if the
 *               vbl semaphore was set it increased to 0.9863. The former
 *               value has been used.
 *       extra : # of ticks needed to handle each repetition.
 *               For this program its value is 32.
 *    The 8000 is in fact due to the processor's clock frequency (8Mhz);
 *    a factor 1000 can be found in the number total, which is expressed
 *    in milliseconds instead of seconds.
 *    Filling in eff and extra and adding (repeat / 2) to the nominator
 *    to achieve rounding of the integer division rather than truncating
 *    yields the formula used.
 */

/* Because stdio and memory allocation were not needed, the module was
 * linked with a different startup.bin that does not load unnecessary code.
 * In this way the program size has decreased from 12666 to 3391.
 */

I'm pleased to announce that comp.sources.atari.st and comp.binaries.atari.st
archives are now available via anonymous ftp from host ftp.Hyperion.COM
(192.65.216.1). If the name doesn't resolve, try again in a little while;
the NIC just updated our NS records today.

The archive server at spud.Hyperion.COM is still up and running for
non-Internet users. Enjoy!

-Steve

[Copied from comp.sys.atari.st, where followups are directed.]

I just posted "reverse" to comp.binaries.atari.st. It's the only submission
I've received for either group in nearly a month, unless you count all the
"Why isn't there anything in this group?" messages.

It seems clear to me that neither group is going to pick up much steam under my direction. When I post the submission guidelines, I get a trickle of new programs, but it dies off quickly.

Originally, this was going to be a simple call for a new moderator, someone who has the time to be a little more proactive about seeking out software to post, which is what I think would be necessary to get any decent volume. But upon further reflection, I started wondering if maybe c.b.a.s (and to a lesser extent c.s.a.s) was really all that useful in its present form.

With the steady increase in popularity of the ftp-based archive sites, many of which can also be accessed directly via E-mail (or indirectly via the various ftpmail servers on the net), does it really make sense any more to broadcast uuencoded binaries to every site on the net?

Perhaps the group should be more along the lines of gnu.announce, where new programs available for ftp (or mail-server access) are announced but not actually posted. This might cut down on what little net bandwidth the group eats; on the other hand, it makes retrieving software on a UUCP-only site slower, sometimes significantly so.

Not, mind you, that I'm opposed to the way the group works now, or to continuing as moderator, but neither of these may be the most effective way to serve the Atari ST user community, which is largely why I got into this moderation thing in the first place.

So what do people think? Should the group continue as is? Should I step down and let someone else take the helm? Should binaries continue to be posted, or should the group switch to a low-bandwidth "announce" format? If it did the latter, would it still be an appropriate member of the comp.binaries hierarchy? And what about comp.sources.atari.st?

The ftp.hyperion.com ftp site (which houses the official comp.sources.atari.st/
comp.binaries.atari.st archives and a lot of Babylon 5 files, thus the
crossposting of this message) will be unavailable until the afternoon of
Monday, April 12. Apparently the ftp server we're using has a nasty security
hole. I won't have time to install the fixed version until Monday, so in the
meantime I'm being paranoid. For Atari users, archive-server@spud.hyperion.com
will not be affected by this shutdown.

Sorry for the inconvenience.

I think it's time for a new moderator for the sources and binaries groups.

For some time now, as everyone is no doubt aware, I haven't been able to
devote as much time to the groups as they deserve. It looks like that'll
continue into the future, and it's not fair to all of you that I continue
to hang on to moderatorship when someone more active could be making the

groups go somewhere.

So: I'm now soliciting volunteers to take over the groups. I think it's best if one person moderates both, simply because most of the stuff in comp.sources.atari.st arrives packaged in with binaries, but of course I'll consider offers to take over just one group.

Requirements:

- Willingness to devote several hours a week, or more, to the groups.
- Some understanding of how Usenet works from a technical standpoint, enough to modify and maintain the posting scripts and other tools.
- Enough disk space to handle the occasional multi-megabyte submission.
- Net access that won't go away (i.e. no students who lose their accounts or don't have access to them over the summer.)

Internet access is a plus, but not required; if someone without Internet access takes the job, naturally, outside arrangements will have to be made if the archives are to be available via ftp.

Please reply to koreth@hyperion.com if you're interested in the job.

Thanks to everyone who's participated in the group over the years. It's been fun.

About a week and a half ago, I posted an article to comp.binaries.atari.st
and comp.sources.atari.st asking for volunteers to replace me as moderator.
One person asked for more information, then never replied to my mail, so I
can only assume he's not interested.

Which makes me wonder: is it time to kill off both groups?

Even when I have time to moderate it properly, traffic is a trickle, and
the various Atari ftp sites get far more submissions than either group.
With the availability of mail servers to fetch things from those sites,
I'm not sure there's a reason for the groups any more. Certainly the
fact that nobody else wants to moderate them is evidence that interest
is fairly low.

If the groups aren't removed, I'm not going to have time to moderate them,
so they will sit idle. I think it's dumb to have groups that nobody can
post to. Removing them entirely seems like a far better solution.

So, I leave it to you to discuss. What should be done? Followups directed
to news.groups, where this sort of thing is supposed to be talked about.

After I posted a while ago asking if the groups should be dissolved, several people stepped forward volunteering to moderate. I'm happy to report that one of them is just about ready to start, so as of now I'm stepping down as moderator.

Please welcome Annius Groenink, avg@cwi.nl, to both groups. Under enthusiastic new management, I hope the groups will take on new life. I'll continue to hang around both groups in an advisory capacity for a while, but this is probably the last posting you'll see from me here.

All new submissions should be sent to the abovementioned E-mail address, and you should adjust your moderators or mailpaths file accordingly until the change is reflected in the List of Moderators maintained at Uunet. The archives will remain at ftp.hyperion.com until I can find another home for them (any volunteers?)

I'd like to thank everyone who participated over the years, both readers and submitters. It's been an interesting ride.

See you all on the net!

Hello everybody.

As Steven Grimm decided to devote his time to other matters, I will from now on be the moderator for the comp.binaries.atari.st and comp.sources.atari.st groups. You will not see many changes. The posting conventions have not changed more than slightly. It is as yet unclear what is going to happen to the archives Steven kept. Therefore you should be aware that it may not be possible to retrieve earlier postings when they have expired.

Please take note of the following issues:

- Submissions to both the binaries and sources groups should now be sent to the following e-mail address:

  avg@cwi.nl

- As ftp archives are becoming a popular alternative for publication of sources and binaries, I will encourage the submission of announcements for uploads to ftp archives. Archive maintainers, feel free to include a note in your uploading instructions encouraging people to submit a short description of their publications to my e-mail address.

- Although I certainly try to do things as well as Steven, I may of course make mistakes in the beginning. In that case, sorry for any inconvenience. Never hesitate to let me know if something is not quite the way you would like to see it.

- For those who have submitted articles to the old addresses, I am working on those. I will post one submission to both groups today, to see if everything works out well. The others will follow soon. If I haven't contacted you about your submission, then either it's still in examination, or it looks OK and it will soon be posted.

Of course, I always appreciate any comments or ideas on how to improve the usefulness of the groups.

I think we'd all like to thank Steven Grimm for the great work he has been doing for the groups. I am also endebted to him for his advice and tools for maintaining the groups.

Thank you all very much and enjoy,

Annius Groenink, Moderator. (avg@cwi.nl)

Submitted-by: euapol@eua.ericsson.se (Tommy Pollak)
Environment: Simula (OK on Falcon030/4MB, not on 520ST)
Posting-number: Volume 7, Issue 1
Archive-name: frontstr.txt

Issue: comp.sources.atari.st, Volume 7 Number 1

Name: FrontStrip - Simula

Description: A Simula Procedure which strips leading blanks off a text.

Configuration: See below.

Simula is one of the first object-oriented programming languages. It enhances Algol 60 with classes and other features. For the Atari there is a port of the Lund Simula system by the Dortmund University in Germany.

The Simula system did not fit my old 520 ST, but works OK on my Falcon030 (4/64 MB).

I would like to share a piece of experience with you.

In the swedish book "Objektorienterad programmering och algoritmer i Simula" by Serafim Dahl and Kjell Lindqvist, Studentlitteratur 1993, a text procedure to strip the leading blanks of a text is defined.

The procedure will not give correct results for texts with exactly one

non-blank character. Below comes a modified version.

```
text procedure FrontStrip (t); text t;
  begin
  t.setpos (1);
  while t.more and then t.getchar = ' ' do;
  FrontStrip :- if t.more then
              t.sub (t.Pos-1, t.length-t.pos+2)
         else
           ! next 3 lines added;
           if t.length > 0 then
                t.sub (t.Pos-1, t.length-t.pos+2)
           else
             Notext
  end of FrontStrip;
```

The posting conventions have not changed more than slightly. It is as yet unclear what is going to happen to the archives Steven kept. Therefore you should be aware that it may not be possible to retrieve earlier postings when they have expired.

Please take note of the following issues:

- Submissions to both the binaries and sources groups should now be sent to the following e-mail address:

  avg@cwi.nl

- As ftp archives are becoming a popular alternative for publication of sources and binaries, I will encourage the submission of announcements for uploads to ftp archives. Archive maintainers, feel free to include a note in your uploading instructions encouraging people to submit a short description of their publications to my e-mail address.

- Although I certainly try to do things as well as Steven, I may of course make mistakes in the beginning. In that case, sorry for any inconvenience. Never hesitate to let me know if something is not quite the way you would like to see it.

- For those who have submitted articles to the old addresses, I am working on those. I will post one submission to both groups today, to see if everything works out well. The others will follow soon. If I haven't contacted you about your submission, then either it's still in examination, or it looks OK and it will soon be posted.

Of course, I always appreciate any comments or ideas on how to improve the usefulness of the groups.

I think we'd all like to thank Steven Grimm for the great work he has been doing for the groups. I am also endebted to him for his advice and tools for maintaining the groups.

Thank you all very much and enjoy,

Annius Groenink, Moderator. (avg@cwi.nl)

This article is posted regularly. It gives a short introduction to comp.sources.atari.st and describes how to submit sources or digressions to the group.

I am always looking for suggestions on how to improve the usefulness of the newsgroup, and can be contacted at the following internet address:

   avg@cwi.nl

Annius Groenink, Moderator.

ABOUT comp.sources.atari.st

The moderated usenet group comp.sources.atari.st contains publications or announcements of sources and texts about programming for Atari TOS computers. The publications on comp.sources.atari.st may be freely

distributed as long as modifications are documented and the original authors are mentioned.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the instructions below for submitting material intended for publication on comp.sources.atari.st.

SUBMITTING SOURCES OR DIGRESSIONS FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent to avg@cwi.nl. If you are on a UUCP-only site, you can send them to uunet!cwi.nl!avg.

If you want verification of arrival, say so at the beginning of your submission, or in a cover note. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while, or be rejected outright.

Sources can be submitted in ASCII form, but for large pacages, a ZOO 2.1 archive encoded using Dumas uuencode is preferred.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected. If necessary, I may put the description through a text formatter or make minor additions in order to make the postings to the group more uniform. I will, of course, never change the actual contents of a submission.

THE STRUCTURE OF COMP.SOURCES.ATARI.ST ARTICLES

There are three types of articles in comp.binaries.atari.st: "information postings", "sources" and "announcements". The source postings are also called "Issues". The type of a posting can be distinguished by the subject line:

```
  Subject: v02inf1: Introduction to comp.sources.atari.st
```

This first word in the title identifies this as the first info posting of volume two. Similarly, the subject line shown below:

```
  Subject: v06i081: godsrc -- Universe simulator
```

identifies this as the 81st source article in Volume 6. Large sources are broken up into smaller pieces, and have subject lines that look like this:

```
  Subject: v06i088: decbustr -- VMS clone in ST-LOGO, Part03/08
```

Announcements of large source packages uploaded to ftp archives are also considered for publication. The subject header for such files looks like

```
  Subject: v07ann007: GCC 7.9.4 -- Same as 7.9.3, but considerably slower
```

Certain information about the system configuration required to use the program is given on the keywords line.

```
  Keywords: MWC, Megamax, 1meg, high
```

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self- explanatory.

```
  Alcyon  - Alcyon C (included with Atari developer's kit)
  MWC         - Mark Williams C
  Megamax - Megamax C
  Laser       - Laser C
  Lattice - Lattice C
  C       - Any C compiler
  OSS         - OSS Personal Pascal
  BASIC       - ST BASIC (this is not a joke!)
  uuencode    - program is uuencoded (uudecode required to unpack)
  arc         - program is archived (arc required to unpack)
  zoo-high    - program is archived (Zoo 2.1 required to unpack)
  lharc       - program is archived (lharc required to unpack)
  high        - high resolution
  medium  - medium resolution
  low         - low resolution
  1meg        - needs 1 meg of RAM
```

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 6, Issue 80
Archive-name: micro-rtx

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

Environment: ANSI C, needs dos.c with countre code identifiers
Posting-number: Volume 7, Issue 2
Archive-name: keytbl/source.part01

Issue: comp.sources.atari.st, Volume 7 number 2

Part: 1/1

Name: keytbl.c

Description: A program which produces the operating system's key tables in 3-column format.

NOTE from the moderator. If you are using an operating system different than UK, please try this program and submit its output. We are planning to compile the key tables for all languages into a comprehensive document describing the use of key codes in GEM applications.

This is C source code for 'keytbl', submitted by Chris Ridd from the Computer Science dept. at the univ. of Birmingham, United Kingdom.

As readers of usenet may have noticed, there has been a discussion on comp.sys.atari.st.tech about key combinations on foreign keyboards. One of the conclusions of this discussion was that it would be nice if we could collect the key tables for as many operating systems as we can get hold of.

'keytbl' generates an ASCII file 'keytbl.tbl' showing your TOS version, the nationality of your operating system and three columns representing the values in the keyboard table for unshifted, shifted and caps-locked keys, respectively.

The binary 'keytbl.ttp' has been posted to comp.binaries.atari.st.

If you are using a TOS in an exotic language (I haven't got the US tables yet, for instance :-) feel free to send the output of keytbl on your computer to the moderator of comp.sources.atari.st:

avg@cwi.nl

In a few weeks, I will compile the results will into a document together

with more general information as well as abstracts from the discussion
on comp.sys.atari.st.tech.

Environment: GFA Basic 3.x
Posting-number: Volume 7, Issue 3
Archive-name: mandelgen/part01

Issue: comp.sources.atari.st, Volume 7 number 3

Part: 1/1

Name: mandelgen

Description: Mandelbrot Generator in simple (GFA Basic) terms

Configuration: GFA Basic 3.x

---

reading some of the docs on fractals, i've discovered that people cannot state the matter in simple terms, much less include code. since GFA is almost like pseudo code, i've decided to write a simple program so that everybody can understand.

as it stands, the program uses low ST resolution, but you can change it to others in minutes.

----cut----

```
'
' simple mandelbrot fractal generator
' in GFA Basic 3.x
' you can use the main program as a pseudo code for a faster
' implementation or whatever.  set_pal and col_rotate just make the final
' result more dynamic.  i hate static pictures.
'

Note from the moderator.

Thanks to everyone who sent in key tables. Unfortunately, the response was disappointing. We have a US, UK, Swiss and German versions. Remember, it's never too late to send in a key table! Especially French and Spanish tables would be welcome!

Also thanks to the one who sent me the 1.4 German TOS table. It is identical to this 3.06 output.

Annius.

---------------------------------------------------------------------

I wouldn't call the SWG (swiss german) TOS exotic but some things are really
a bit strange (see below). A lot of work is done in the keyboard driver, to
include a number of special characters like german/french umlaute, pound
sign etc.

gruss, pat

Posting-number: Volume 8, Info 1

This article is posted regularly. It gives a short introduction to comp.sources.atari.st and describes how to submit sources or digressions to the group.

I am always looking for suggestions on how to improve the usefulness of the newsgroup, and can be contacted at the following internet address:

avg@cwi.nl

Annius Groenink, Moderator.

ABOUT comp.sources.atari.st

The moderated usenet group comp.sources.atari.st contains publications or announcements of sources and texts about programming for Atari TOS computers. The publications on comp.sources.atari.st may be freely distributed as long as modifications are documented and the original authors are mentioned.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the instructions below for submitting material intended for publication on comp.sources.atari.st.

SUBMITTING SOURCES OR DIGRESSIONS FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent to avg@cwi.nl. If you are on a UUCP-only site, you can send them to uunet!cwi.nl!avg.

If you want verification of arrival, say so at the beginning of your submission, or in a cover note. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while, or be rejected outright.

Sources can be submitted in ASCII form, but for large pacages, a ZOO 2.1 archive encoded using Dumas uuencode is preferred.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. If necessary, I may rewrite or add to this information in order to make the postings to the group more uniform. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected.

THE STRUCTURE OF COMP.SOURCES.ATARI.ST ARTICLES

There are three types of articles in comp.binaries.atari.st: "information postings", "sources" and "announcements". The source postings are also called "Issues". The type of a posting can be distinguished by the subject line:

```
Subject: v02INF1: Introduction to comp.sources.atari.st
```

This first word in the title identifies this as the first info posting of volume two. Similarly, the subject line shown below:

```
Subject: v06i081: godsrc -- Universe simulator
```

identifies this as the 81st source article in Volume 6. Large sources are broken up into smaller pieces, and have subject lines that look like this:

```
Subject: v06i088: decbustr -- VMS clone in ST-LOGO, Part03/08
```

Announcements of large source packages uploaded to ftp archives are also considered for publication. The subject header for such files looks like

```
Subject: v07a007: GCC 7.9.4 -- Same as 7.9.3, but considerably slower
```

Certain information about the system configuration required to use the program is given on the keywords line.

```
Keywords: MWC, Megamax, 1meg, high
```

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self- explanatory.

```
  Alcyon  - Alcyon C (included with Atari developer's kit)
  MWC         - Mark Williams C
  Megamax - Megamax C
  Laser       - Laser C
  Lattice - Lattice C
  C       - Any C compiler
  OSS         - OSS Personal Pascal
  BASIC       - ST BASIC (this is not a joke!)
  uuencode    - program is uuencoded (uudecode required to unpack)
  arc         - program is archived (arc required to unpack)
  zoo-high    - program is archived (Zoo 2.1 required to unpack)
  lharc       - program is archived (lharc required to unpack)
  high        - high resolution
  medium  - medium resolution
  low         - low resolution
  1meg        - needs 1 meg of RAM
```

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

```
  Submitted-by: david@bdt.UUCP (David Beckmeyer)
  Posting-number: Volume 6, Issue 80
  Archive-name: micro-rtx
```

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

```
Archive-name: desktop/part01
```

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

WELCOME!

There are lots of things you can do with the new Atari desktops (and with the old ones!); almost as much as with a replacement desktop like NeoDesk© from Gribnif Software! Unfortunately, the manuals Atari gives us with the computers don't tell you about all of these great features. I will try to rectify this deficiency.

I have compiled as much information on the NEWDESK.INF file that I could, and thrown in some info on TOS 2.06. This file focuses on Atari's NEWDESK.INF file, and in particular on TOS 2.06, since they are what I have. If you don't have TOS 2.06, don't worry; most of the really useful info in here is applicable to *all* versions of TOS, and some info specific to TOS 4.0x is included, too. I have tried to point out where information may be specific only to certain versions of TOS. With this as a reference, you should be able to modify your DESKTOP/NEWDESK.INF file to do almost anything with your desktop!

I have learned all of this partly through trial and error, and partly through discussions on online services. A lot of the information came to me by way of the NEWDESK topic on GEnie in the Atari Roundtable. GEnie, by the way, is an excellent source of information and support for the Atari line of computers; being the only official online Atari service, there are more Atarians there than anywhere else. I highly recommend this service. I suppose I should state that I have no connection with GEnie other than as a satisfied user. Another excellent source of info and programs is the Internet, where Atarians from all over the world can (and do!) converse and share programs.

If you find that something is wrong, please let me know! If you see something I missed, or if you think I should include some information that isn't in here, let me know that, too. And of course, suggestions are always welcome. When contacting me, include your machine type, TOS, GEM, AES, MiNT, and MultiTOS versions (whichever apply). This will help me decipher different, unknown parameters. If you don't know some of this information or don't have MiNT or something, don't let that stop you from contacting me! But please, try to include at least the TOS version (TOS date will suffice, if necessary; just give me the copyright dates in the "Desktop Info..." menu). Also include your name and some way that I can get in touch with you, such as email address or postal address.

DESKTOP/NEWDESK BASICS

The DESKTOP.INF and NEWDESK.INF files in Atari computers contain all the information your computer needs to configure itself. It contains all the names, positions and (for appropriate TOS versions) icon numbers for your desktop icons. It stores all the info on Installed Apps, desktop icons, and window positions (even for windows that have been closed!). If you leave a window open when saving the desktop, the location, current directory, and file mask (for those versions of TOS that support masks) are saved. It stores info on whether or not the key click and system bell are turned on, the repeat rate for key clicks, mouse double click rate and tracking rate, current resolution, keyboard shortcuts for menu items (in TOS >= 2.0x), and lots more. In short, it stores every peice of information that you can configure from the desktop or the standard Atari Control Panel.

When you boot up your machine, the computer loads in auto programs and then reads the DESKTOP/NEWDESK.INF (hereafter referred to collectively

as simply "INF") file for information on resolution, windows, etc. If you have Atari's Control Panel (or a replacement), the key repeat rate, printer and serial port configuration, and other information is also loaded from the INF file and configured.

To change the INF file, you need simply alter a setting from either the Control Panel (not the extensible control panel, however) or one of the desktop menus, and then select "Save Desktop." If you do this several times and display the INF file after each save, you will get a feel for which changes to the desktop correspond to changes in the INF file. Before doing this, of course, make a backup of your original INF file by renaming it to DESKTOP.INX. This way if you somehow "break" the INF file, you can always be sure to have a working one handy.

You can view the file directly from the desktop; the INF file is simply an ASCII file! This means that not only is everything in the file plainly visible from the desktop, but you can load it into just about any word processor, text editor, or DTP program and edit it by hand. This has the advantage of allowing you to make certain changes that the desktop doesn't allow for. If you're really familiar with the INF file, you can also make multiple changes in much less time than it would take you from the desktop. The editor, however, must be able to load and save files in ASCII format, and it must not strip trailing spaces from lines (more on this in a moment).

One important bit of information to know and understand when editing the INF file is how TOS reads and applies the information in it. Not surprisingly, the INF file acts as a filter, through which TOS sifts programs and files to apply various actions (running files, assigning icons, etc.). What *is* surprising is that these filters work in reverse order from what you see in the INF file. The *last* entry in the INF file is the *first* filter applied! The way this works is as follows:

> For icon assignments, TOS reads from the end of the file to the beginning, comparing each file in a directory to each filter (icon assignment) until a match is found. When TOS finds a match, it moves on to the next file. So if you have a program SQUISHII.APP, and assign an icon to it, that assignment should go toward the end of the file, that way it will be filtered out early on. If you have an icon assingment like #I xx xx xxx @ *.*@ @ *below* the assignment for SQUISHII.APP, then SQUISHII.APP will be filtered out at the *.* (and assigned that icon) rather than at #I xx xx xxx @ SQUISHII.APP@ @ . Hence, you would never see the special icon you assigned to SQUISHII.APP. This is important to understand, for two reasons. The first is that when editing the INF file, you want to work down the file from most general to most specific; getting this order wrong will give you results other than what you wanted. The other reason is that when you make an icon assignment from the desktop, it is saved at the end of the INF file. If you were to make lots of assignments, then do a generic (*.*) icon assignment, all your files would use the generic icon (until you edited the INF

file to have *.* be the last filter applied).

For program assignments, TOS reads the INF file in the same way as for icons, and applies filters in the same way. When you double click on a file (whether it's executable or not), TOS starts looking for matches from the bottom of the INF file and works its way to the top. If you were to install a program VIEWER.APP for file type *.*, this assignment would be saved at the end to the INF file, and hence be the first filter TOS saw; all files, no matter what type they were, would cause VIEWER.APP to run and they would be loaded in to it. This is true even for PRGs, APPs, TOSs, etc.; in the INF file, these are just treated as applications installed with no file type. As with icons, if you edit the INF file make sure you work from most general at the top of the INF file to most specific at the bottom.

EDITING THE INF FILE

Before you begin editing your INF file, make sure that you have a backup of you current, working version! It is possible (and fairly easy, really) to change the INF file so that the computer will become "confused" and not boot!

Probably the first thing to remember when editing your INF file is that NEWDESK.INF can't be larger than 4kb (4096 bytes), and starts causing trouble with the system around 3900 bytes. Similarly, the DESKICON.RSC can only be 64kb (65536 bytes). The newer DESKCICN.RSC (the color icon resource for TOS 4.0x and up) can be larger than this, though I don't know if there is a limit. If you try to exceed the limit, you'll get "Out Of Memory" errors and lots of headaches.

On earlier versions of TOS (less than 2.0x), the limit on DESKTOP.INF is even more restrictive; it can't be larger than 1kb (1024 bytes)! However, you also don't have a lot of icon assignments eating up that space, so it's a fair trade.

One excellent way around this is to have a directory full of different INF files; a specific one for each task. If you put only those application and icon assignments necessary for a particular task, you should have no problem avoiding the size limit. To switch between INF files, then you can just install either Charles F Johnson's shareware product Desk Switch 1.1 or Klaus Pederson's public domain Load Inf as the application for file types of *.INF. That way, when you want to change to a different task, just double click on the appropriate INF file, and away you go with all the key assignments, installed apps, desktop icons, and icon assignments you want for that task.

Another way around this is to get a program like GEMRAM, which loads GEM into RAM, and the program Shell Buffer (SHBUFxxx.PRG), which lets you configure the allowed size of the INF file.

Both solutions should work great on any Atari, and both have their advantages and disadvantages. Give them both a try and see which works best for you.

Something else to keep in mind when editing your INF file is that TOS expects to find certain formats at certain locations in the file. Line #d, for instance, has to have a certain number of spaces in it since TOS looks roughly 124 bytes into the INF file for the next line (#Z if you have TOS >=1.04 and a program set to auto boot, or #K for the menu key equivalents). That number for the bytes, incidently, also includes carriage returns (EOL characters). Before changing your desktop file, be sure you know *exactly* how many spaces belong in line #d; the wrong number can produce unpredictable results and fatal errors. To find out, of course, just load the file into a text editor that doesn't strip trailing spaces (Word Writer, Alice, Everest, and tons more) and start counting!

Most other lines (but not all of them) in the INF file require a trailing space, so if you edit your file be sure to know which ones need a space and which ones don't.

What this all means, of course, is that if you edit your DESKTOP.INF or NEWDESK.INF file make sure you're using an editor that doesn't strip trailing spaces, and which saves files as ASCII text. And, as always, KEEP A BACKUP OF YOUR ORIGINAL INF FILE!

THE KEYBOARD AND INSTALLING APPS

With the newer TOS versions, you can open a drive into a window by pressing <Alt> and the drive letter. If you want to open a drive into the current top window, you don't have to close the window and then open the drive; just hold down <Cntrl> and press the drive letter! The window will automatically be changed to the root directory of whatever drive you selected.

With TOS versions 2.0x and up, Atari has made it possible to assign a keyboard equivalent to any of the desktop menu items. That way you can select a file and hit "I" to get info on it. Unfortunately, the mneumonics can get pretty complicated, since there are also items that could use "I" like "Show as Icons" and "Install Icon." "D" could be used for "Sort by Date," "Delete," and "Install Devices." The desktop appears to only allow normal characters (capital A through Z) for these assignments, which gets pretty limiting. Luckly, you can also use control-key combinations! When changing the menu assignments in the Desktop Configuration menu, just hold down the <control> key while pressing your key. Now, instead of accidently deleting a file by pressing "D," you can assign <cntrl><delete> (or <cntrl><D>, if yo prefer) to "Delete," and never have to worry about accidentally deleting a file!

Take note! If you use a control-key combo for a particular menu item,

that combo will no longer be available for normal desktop usage. For instance, if you assign <cntrl><D> to "Show by Date," <cntrl><D> will no longer be used to open drive D into the currently active window, instead it will be used to delete selected files.
Remember:
  Alternate + (A-P) = Open the drive's directory into a window
  Control   + (A-P) = Open the drive's directory in the active window
You can get all of the normal Desktop key commands by pressing <help> while at the Desktop.

Not only can you assign a key combo to "Delete," you can also remove the trash icon completely, and free up space for more important icons! Just select the Trash icon and then the menu item "Remove Icon." In fact, since TOS versions 2.0x and up allow you to open drives by pressing <alternate> and the drive letter, you can remove all the drive icons, too, and replace them with programs, folders, and files! If you need to actually see what's on drive D, just press <Alt><D>.

Something users of *any* TOS version can do is install more than one document type for an application! To do this, first install the application for one of the filetypes you want. Then load the DESKTOP/NEWDESK.INF file into an ASCII editor. Make a copy of the installed application line, making sure to keep all the copies together with the original in the .INF file. It will look something like:
   #Y FF 04 000 C:\path\GEMVIEW.GTP@ *.PI3@ @
Then rename the installed file type ("*.PI3") to whatever other file type you want. Make sure to keep all of these lines together. After doing this a few times, you might have the following lines in your .INF file:
   #Y FF 04 000 C:\path\GEMVIEW.GTP@ *.PI?@ @
   #Y FF 04 000 C:\path\GEMVIEW.GTP@ *.PC?@ @
   #Y FF 04 000 C:\path\GEMVIEW.GTP@ *.GIF@ @

Editing your INF file manually like this is the only way to install one application for more than one file type, since using "Install Application" from the desktop will just overwrite any previous assignment, rather than adding to it.

Of course, instead of installing an application for a particular extender, you might try editing the lines for a particular *prefix*! You could do something like:
   #G 03 04 000 C:\UTILS\FILE_VIE.WER\AV380.PRG@ READ*.*@ @
So that whenever you double clicked on a file like "READ.ME", ASCII View 3.80 would be run and the file loaded into it for viewing!

In fact, you can replace the Desktop's boring old [SHOW | PRINT | CANCEL] by installing an application for all file types. Be careful; since this works as a catch-all, you have to make sure that such an installation is the *last* line TOS checks when you double click. That means it has to be the first application line in the .INF file (remember, TOS uses the DESKTOP/NEWDESK.INF file as a sort of filter, working from the end of the .INF to the beginning. Basically, the

place to install an app like this is the line just before the *.APP, *.PRG, *.TOS, etc. is defined. See the annotated INF file below for an example.

NEAT HACKS

In any version of TOS you can, of course, change the name of any desktop icon to anything you want. This is true of the Trash can, which can be renamed HAZARD or whatever you want. It's also true of any programs or folders you put on the desktop (in TOS >= 2.0x); Just look at the line of the INF file where that file/folder appears. It will look something like:
#X 07 01 7B FF C:\UTILS\VIEWERS\VIEWER.PRG@ VIEWER.PRG@
The name seen on the desktop will be "VIEWER.PRG." You can change this to "SEE IT!" just by changing the line to something like:
#X 07 01 7B FF C:\UTILS\VIEWERS\VIEWER.PRG@ SEE IT!@

Of course, as I said above, you don't really need the trash or drive icons on TOS >= 2.0x, so why not just get rid of them? You can free up tons of space on the desktop for commonly used programs, files, and folders. It also has the nice side-affect of freeing up space in your INF file, allowing you to have a few more lines of icon or application assignments. This is a great tip for people who use Desk Switch or Load Inf; you can replace the drive icons with INF file icons, allowing you easy access not to your drives but to the work you need to do.

One feature that deserves to be recognized, though it isn't a hack, is the drag and drop feature of TOS >= 2.0x. With this feature, you can put your commonly used programs on the desktops and then just drag the file you want to work on over the app (until the app is highlighted), then "drop" the file. This has the advantage of requiring fewer steps to get working, as well as not requiring you to install the application in the INF file, thereby saving a few bytes of space.

Create INF files specific to programs, put them all in a common folder, and use Desk Switch or Load Inf to switch between them. You can have a DTP.INF, WORDPROC.INF, GEMDRAW.INF, DEGAS.INF, TELECOM.INF, UNARC.INF, etc. This frees up a lot of space in any particular INF file. And with each INF, each type of file used with that task can have its own unique icon, so it's easy to distinguish file types, and you can also have all the installed application info you want! Using just one INF file really limits you in what you can do, so make more!

Reset your keyboard-equivalents for the desktop menus so they make sense! Use normal keys for one menu, and <cntrl>-key combos for the other. You can even try <shft><cntrl>-key combos. Require two keys to be pressed when deleting or formating.

Get a resource editor (like MKRSC; this works with TOS 4.0x icons) and build your own icons, then assign them by hex number to files in your

INF file.

Put a folder on the the desktop and save the INF file. Then edit the INF file so that the line containing that folder begins with #X instead of #V. Now when you double click on the folder, the default document displayer is run, and the contents of the folder are loaded in a batch mode. This is an excellent way of viewing new pictures or text files! You can even use masks to control what sort of files load in. Of course, your viewer has to be capable of processing batch jobs.

Make yourself a blank icon (no mask, nothin'). You can now assign short notes to the name of the icon, such as Fkey assignments, short reminders, and whatnot. If you have TOS >= 2.0x, you can put these "sticky notes" on the desktop, too. They are easily editable from the desktop.

INF FILE COMPOSITION

Below is a (fairly) complete explanation of the lines in the DESKTOP.INF or NEWDESK.INF files. Some parameters only apply to specific versions of TOS. Compare what's below to what is already in your .INF file, and if it's not already there, DON'T ADD IT! TOS expects certain lines to have a particular format, and adding to these lines can confuse TOS and give you headaches. On the other hand, deleting things can have the same effect, so don't do that either.

Where a description is given by "bits," the following procedure will produce the needed hexidecimal number:

> start with the high bit (e.g. bit "7"), and begin writing down the desired configuration as a binary number (1's and 0's) from left to right. Unlisted bits should not be changed. When the number is complete, convert it to hex. Any decent calculator will do this without a fuss.
> For example: For the "Other configuration parameters" (see below), I want bit 4 set to "filname," so I write a 0; bit 3 I want set to "top window", so to the right of the zero I write another 0; then bit 2 I set "size to fit" on, so I write a 1 to the right of bit 3; bit 1 is not listed so I write a 1 (since that's what it was originally); finally bit 0 I want set to "sort on," so I write a 0. The resulting number is "00110." I set my calculator to "bin" and plug this number in, then convert it to hex (by changing the calculator mode to "hex"). The resulting number, which goes in the fourth column of line #E is 06.

If you aren't familiar with doing this, I suggest you try it out a couple times and compare it with what's already in your desktop file. Don't try changing anything until you are confident you can get it right! Wrong values can do unpredictable things to your system,

including causing it to crash!

I have been unable to determine the usage of some bits. In these cases, I list the bit with a question mark and give the current value in my NEWDESK.INF file. Yours may be different, so check it and use whatever your INF file uses. To check it, convert the current hex value to binary: the rightmost number is bit 0, the digit to the left of that is bit 1, and so on. Converting hex 06 to bin is 110: bit 0 = 0; bit 1 = 1, bit 2 = 1, bit 3 = 0 (not shown), and bit 4 = 0 (also not shown).

And remember, if you find you've made a mistake, just delete the broken .INF file and re-load the old version that you backed up.

All "@" symbols must be followed by a space.

==========

Keyboard equivalents (available on TOS >= 2.0x)

#K xx xx xx xx ... @
  next 28 columns = hexidecimal value of kbd equiv. (00 = none)
  next 2 columns = 00
  next column = Video prefs. key (not on all TOS versions)

        A = Color #10      ...      F = Color #16

    W = Window Background Pattern

        0 = transparent             1 = Pattern #1
        2 = Pattern #2     ...      7 = Solid

    B = Window background color

        0 = Color #1                1 = Color #2
        A = Color #10      ...      F = Color #16

=====================================================================

Installed Applications have the following info

   #n 04 04 000 C:\path\progname@ *.*@ @

Where #n is any of the following:
     #G  for GEM prg
     #Y  for GTP prg
     #P  for TTP prg
     #F  for TOS prg

The first 04 is the prg icon.  Changing this has no effect
The second 04 is the document icon.  Changing this has no effect.
Both of these should be set to the same value.

  000  contains the following information :

       First Digit  -   Number           Meaning
                          0      Default Directory = Top Window
                                 Parameter = Filename Only
                          1      Default Directory = Application
                                 Parameter = Filename Only
                          2      Default Directory = Top Window
```

```
                                Parameter = Full Path
                           3    Default Directory = Application
                                Parameter = Full Path

       Second and Third Digit  =  Function key assignment F1 to
       shiftF10:
                  00 = no assignment      01 = F1
                  0A = F10                0F = F15
                  10 = F16                14 = F20
```

Following this is the full path and file name, followed immediately by an "@" symbol. After the "@" is a space followed by the installed document type (if any), followed by a second "@". Next comes another space followed by any parameters that are to be passed to the program (for GTP or TTP programs). Finally comes another "@" and a space.

For example,

```
  #P FF 04 009 C:\PATH\VIEWER.TTP@ *.*@ @
```

would install the program VIEWER.TTP as the default document displayer (this then supercedes the desktop [SHOW | PRINT | CANCEL]). This line also sets VIEWER.TTP to run when F9 is pressed. There are no parameters passed to this program.

==========

Default window icons-

```
 Example: #G 03 03 000 @ *.PRG@ @
```

First column = type
- #I = specific file or file type *
- #N = non-specific file *
- #D = folder
- #G = Gem app
- #Y = GTP app
- #P = TTP app
- #F = Tos app

second column = default icon # for #G, #F, #Y, #P
- New default icon can be installed for app type by changing this #

third column = default icon # for #N, #D
- New icon can be installed for non-prg files by changing this #

Both the second and third column should contain the same hexidecimal number.

fourth column - function key assignment. Leave at 000 (no assingment)

fifth column - @ filename.ext@ @ wildcard

```
* #I assigns an icon to the specified file or file type.  It does not
  assign an action.
  #N assigns an icon to the specified file or file type and specifies
  it as a non-executable file.  If the line
      #N 0B 0B 000 @ *.*@ @
  appears below the default lines for APP, PRG, etc. (i.e.
      #G 03 FF 000 *.APP@ @ @
      #G 03 FF 000 *.PRG@ @ @ etc.),
  programs will not execute when double-clicked on.

=====================================================================

Desktop Icons-

 Example: #X 08 02 18 FF   C:\UTILS\VIEWER\VIEWER.PRG@ SEE IT!@

first column = type
    #M = Storage Device
    #T = Trash
    #O = Printer
    #X = Application
    #V = Directory

second column = horizontal position in icon widths

third column = vertical position in icon widths

fourth column = Hex value of Icon number in DESKTOP.RSC

fifth column = FF (function unknown)

sixth column = Device ID (A-P) or space

Finally: full path and filename@ icon label@  (for a file or folder)
         Device name@ @                       (for a device)

=====================================================================

Annotated NEWDESK.INF File:
---------------------------

#a000000
Stores serial communication info.  Not very important since
the terminal program alters this info anyway.

#b000000
Printer Configuration:
   digit \ setting      0              1
     1              dot matrix      daisy wheel
     2            black & white       color
     3              1280 dpl         960 dpl
```

```
     4                draft           final
     5              parallel         serial
     6             continuous      single sheet

#c777000700060007005520050555222077055707505550770311110 3
Color palette settings, mouse double-click response, key-click, bell
sound, key delay and key repeat rate.

#d
Reserved.  Needs to have roughly forty-seven spaces since GEM looks
roughly 124 bytes into the file for the next line.

#Z 01 F:\RUNPROG\PROGRAM.PRG@
Program to Auto-run at bootup.  Does not apply to TOS earlier than
1.04.

#K 4F 49 53 1F 46 20 43 00 41 4D 00 09 14 0E 04 13 05 0F 00 00 00 01
00 12 00 52 00 44 00 00 @
Keyboard assignments for desktop menu items. (should all be on one
line)

#E 50 13 00 06
Default screen resolution; window sorting method; show as icon
or text; confirm copies, deletes, etc.  Second digit of the second
byte is for screen resolution: 13 = blitter on, ST High rez.

#Q 41 00 43 40 43 40

#W 00 00 02 07 4B 11 00 F:\RUNPROG\*.PRG@
#W 00 00 16 02 35 0B 00 @
#W 00 00 2E 0E 22 0A 00 @
#W 00 00 00 0C 21 0C 00 @
#W 00 00 00 04 4C 0C 00 @
#W 00 00 02 0D 4C 09 00 @
#W 00 00 0E 0F 2A 09 00 @
#W 00 00 06 01 34 09 00 @
Default window locations, sizes, and open directories and masks.

#P 03 04 000 C:\UTILS\FILE_VIE.WER\GUCK18\GUCK.TTP@ *.*@ @
This line installs Guck as the default file viewer.  When the file is
double clicked on, TOS checks all the #G, #P, #Y, and #F assignments
below, and if the file doesn't match any of those, Guck is run and the
file is loaded in.  Notice that it is the first assignment in the INF
file, and hence the last assigment TOS checks.  If you moved this one
down a few lines (say, underneath #F 03 04 000 *.TOS@ @ @ ), you'd
never get any programs to run; everything (except the .INFs and
archives) would be loaded directly into Guck!

#G 03 FF 000 *.ACC@ @ @
 - This line lets you run an ACC as a program, if the ACC is capable of it,
 by double-clicking on the ACC in any window.

#G 03 FF 000 *.APP@ @ @
```

```
#G 03 FF 000 *.PRG@ @ @
#Y 03 FF 000 *.GTP@ @ @
#P 03 FF 000 *.TTP@ @ @
#F 03 04 000 *.TOS@ @ @
#G 03 A0 200 C:\UTILS\ARC\STZIP26\STZIP.PRG@ *.ZIP@ @
#G 03 2F 200 C:\UTILS\ARC\TWOINONE.PRG@ *.ARC@ @
#G 03 2F 200 C:\UTILS\ARC\TWOINONE.PRG@ *.LZH@ @
#G 03 2F 200 C:\UTILS\ARC\TWOINONE.PRG@ *.ZOO@ @
#G 03 2F 200 C:\UTILS\ARC\TWOINONE.PRG@ *.ARJ@ @
#G 03 2F 200 C:\UTILS\LOADINF\LOADINF.PRG@ *.INF@ @
Executable programs and programs to run when files with the
appropriate mask are opened.  The second two digits of the third
column of numbers ("00" of the "200") is the hex number of the
function key assignment.  "0A" would be F10.
Other parameters (for GTP or TTP) can be included before the last "@".

#D 0A 0A 000 @ *.*@ @
Default folder icon

#I 0B 0B 000 @ *.*@ @
Default file icon

#I 0C 0C 000 @ *.PR?@ @
#I 11 11 000 @ *.AC?@ @
#I 2E 2E 000 @ *.CPX@ @
#I 3A 3A 000 @ *.TTP@ @
#I 0D 0D 000 @ *.TOS@ @
#I 39 39 000 @ *.APP@ @
#I 39 39 000 @ *.PRG@ @
#I 12 12 000 @ *.ACC@ @
#I 52 52 000 @ READ*.*@ @
#I 52 52 000 @ *.ME@ @
#I 2C 2C 000 @ *.INF@ @
#I 13 13 000 @ *.RSC@ @
#I 3B 3B 000 @ DC*.*@ @
#I 1B 1B 000 @ *.HLP@ @
#I 6F 6F 000 @ G+*.*@ @
#I 3C 3C 000 @ DATADIET.*@ @
#I 46 46 011 @ WORDUP.PRG@ @
#I 49 49 004 @ QVIEW.PRG@ @
#I 51 51 000 @ SUPER*.PRG@ @
#I 63 63 002 @ PGS2.PRG@ @
#I 70 70 000 @ WARP9_ST.PRG@ @
#I 73 73 000 @ DFORMAT.PRG@ @
#I 3D 3D 00A @ SQUISHII.APP@ @
#I 6D 6D 001 @ TWOINONE.PRG@ @
File icons and function key assignments.  Notice these act as filters
also, and hence files are applied from the bottom up.  For example,
SQUISHII.APP is assigned icon 3D, but a file called SQUID.GHU doesn't
match any filter, it would be assigned the default icon 0B.

#D 4E 4E 000 @ TELECOMM@ @
#D 3E 3E 000 @ AUTO@ @
```

```
#D 37 37 000 @ CLIPBRD@ @
#D 53 53 000 @ ACCS@ @
#D 55 55 000 @ CPX@ @
#D 35 35 000 @ TEXTE@ @
#D 36 36 000 @ BILDER.PAD@ @
#D 36 36 000 @ MYDRAW@ @
#D 36 36 000 @ META@ @
#D 36 36 000 @ GRAPHICS.Z@ @
#D 4F 4F 000 @ GAMES@ @
Folder icon assignments.  Again, assignment is from bottom to top.

#M 00 00 00 FF A FLOPPY DISK@ @
#M 01 00 02 FF C BOOT@ @
#M 02 00 02 FF D PUBLISHING@ @
#M 03 00 02 FF E FILES@ @
#M 04 00 02 FF F PROGRAMMING@ @
#M 05 00 02 FF G GRAPHICS@ @
#M 06 00 02 FF H TELECOM@ @
#M 05 01 05 FF M RAM DISK@ @
Drive icon, letter, position, and label assignments.

#O 06 01 08 FF   PRINTER@ @
Printer icon, position, and label assignment.

#T 07 00 09 FF   GARBAGE@ @
Trash icon, position, and label assignment.

#X 07 01 7B FF   C:\UTILS\RECV_CAN\RT.PRG@ TRASH CAN@
Executable file on the desktop.  Icon, position, and label assignment.

#V 04 01 3E FF   C:\AUTO\SUPERBT\*.INF@ DESKTOP@
Directory folder on the desktop.  Position, icon, pathname, and label
assignment.

COMMENTS
--------
   Notice if a file is clicked on and is not a *.INF or one of the
listed archival types, TOS then checks to see if it is either TOS,
TTP, GTP, PRG, or APP (in that order), and if so executes it.  If it
is not one of these, the remaining installation for types *.*
"catches" it, so GUCK  will be run and the file will be loaded in.
This then replaces the  desktop [ SHOW | PRINT |CANCEL].  Remember
that each of these acts as a filter and that TOS applies them from
*bottom* to top; so when you double-click on a file, TOS first checks
to see if it is *.INF, and if so runs LOADINF.PRG, then it checks for
type *.ARJ, then... through the executables (TOS, TTP, GTP, PRG, APP
in that order), and finally if the file wasn't one of those, TOS type
*.* (that's everything left) is loaded into GUCK.

******************************END OF FILE**************************
```

Posting-number: Volume 8, Info 4

This article is posted twice a month. It gives a short
introduction to comp.sources.atari.st and describes how to submit
sources or digressions to the group.

I am always looking for suggestions on how to improve the usefulness of
the newsgroup, and can be contacted at the following internet address:

   avg@cwi.nl

Annius Groenink, Moderator.

                    ABOUT comp.sources.atari.st

The moderated usenet group comp.sources.atari.st contains publications
or announcements of sources and texts about programming for Atari TOS
computers. The publications on comp.sources.atari.st may be freely

distributed as long as modifications are documented and the original authors are mentioned.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the instructions below for submitting material intended for publication on comp.sources.atari.st.

SUBMITTING SOURCES OR DIGRESSIONS FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent to avg@cwi.nl. If you are on a UUCP-only site, you can send them to uunet!cwi.nl!avg.

If you want verification of arrival, say so at the beginning of your submission, or in a cover note. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while, or be rejected outright.

Sources can be submitted in ASCII form, but for large pacages, a ZOO 2.1 archive encoded using Dumas uuencode is preferred.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. If necessary, I may rewrite or add to this information in order to make the postings to the group more uniform. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected.

THE STRUCTURE OF COMP.SOURCES.ATARI.ST ARTICLES

There are two types of articles in comp.binaries.atari.st: "information postings" and "sources". The source postings are also called "Issues". For a while, 'announcements' were also accepted, but there is now a dedicated group, comp.sys.atari.announce, for that purpose. The type of a posting can be distinguished by the subject line:

```
  Subject: v02INF1: Introduction to comp.sources.atari.st
```

This first word in the title identifies this as the first info posting of volume two. Similarly, the subject line shown below:

```
  Subject: v06i081: godsrc -- Universe simulator
```

identifies this as the 81st source article in Volume 6. Large sources are broken up into smaller pieces, and have subject lines that look like this:

```
  Subject: v06i088: decbustr -- VMS clone in ST-LOGO, Part03/08
```

Certain information about the system configuration required to use the program is given on the keywords line.

```
  Keywords: MWC, Megamax, 1meg, high
```

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self- explanatory.

```
  Alcyon  - Alcyon C (included with Atari developer's kit)
  MWC         - Mark Williams C
  Megamax - Megamax C
  Laser       - Laser C
  Lattice - Lattice C
  C       - Any C compiler
  OSS         - OSS Personal Pascal
  BASIC       - ST BASIC (this is not a joke!)
  uuencode    - program is uuencoded (uudecode required to unpack)
  arc         - program is archived (arc required to unpack)
  zoo-high    - program is archived (Zoo 2.1 required to unpack)
  lharc       - program is archived (lharc required to unpack)
  high        - high resolution
  medium  - medium resolution
  low         - low resolution
  1meg        - needs 1 meg of RAM
```

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

```
  Submitted-by: david@bdt.UUCP (David Beckmeyer)
  Posting-number: Volume 6, Issue 80
  Archive-name: micro-rtx
```

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

HOW TO OBTAIN OLD ISSUES

There is currently no officially documented archive for this group.

Our LAW FIRM offers direct guaranteed effective credit restoration services by experienced attorneys. THIS IS NOT A DO-IT-YOURSELF KIT.

What can we do?

We have successfully facilitated the removal of Late Payments, Charge-offs, Foreclosures, Repossessions, Collection Accounts, Loan Defaults, Tax Liens, Judgments and Bankruptcies from our clients' credit reports. WE GUARANTEE THAT YOUR CREDIT CAN BE RESTORED!!!

Who needs our services?

Anyone who has experienced the inconvenience and embarrassment of being turned down for a credit card, a lease or a purchase of an automobile.

Anyone who is unable to buy the house of their dreams due to denial of a mortgage application or who has to pay thousands of dollars more in mortgage interest than someone with good credit.

Anyone who has been turned down for a job or promotion due to derogatory credit items on a credit report.

Anyone in business who has lost a deal because a person or firm wanted to see his/her credit report before doing business.

Anyone who has been unable to establish credit.

THE FOUR GREAT MYTHS OF CREDIT:

Myth #1: It is illegal or immoral to have your credit report cleared.

> Fact: It is not illegal nor immoral. In fact, that is what the Fair Credit Reporting Act is all

about. The act was enacted by Congress in 1971. One of its purposes as to give consumers the protection of the law and to help guard against any unwarranted invasion of a consumer's right to privacy.

Myth #2: The information on a credit report cannot be changed.

Fact: Actually, the opposite is true under the Fair Credit Reporting Act. Federal and State laws require that items be removed if they are not 100% accurate or cannot be verified in a timely manner.

Myth #3: It is impossible to get a bankruptcy off a credit report.

Fact: Bankruptcies can come off credit reports like any other derogatory item. The nature of the derogatory item has nothing to do with its removal under the Fair Credit Reporting Act.

Myth #4: Credit Reporting Agencies are empowered with some kind of governmental authority.

Fact: Absolutely Not!! They are simply large corporations whose primary goal is to make a profit like any other business.

If you have ever applied for or received credit, a file exists in one or more of the credit bureaus. These companies collect, store and distribute as much credit information as they can find, retaining negative information on a credit report for 7 to 10 years. This information is evaluated by potential creditors to determine your credit worthiness.

Credit reporting agencies are in business to protect the interests of the creditors. the LAW FIRM's goal is to help and protect the individual consumer from inaccurate credit reporting.

The president of our LAW FIRM has been practicing consumer law since 1984. The staff of our firm has successfully processed, disputed and challenged thousands of client credit reports.

Our legal fee is based o the number of negative items that appear on a client's credit reports, issued b the three national credit bureaus. Our retainer agreement offers a MONEY BACK GUARANTEE stating that if any

negative item is not deleted, upgraded or corrected from a client's credit file, it will give the client a full refund for that item or continue to process the client's file at no additional fee until that item is corrected, upgraded or deleted. THE ONLY THING YOU HAVE TO LOSE IS YOUR BAD CREDIT!!

PLEASE CONTACT THE LAW FIRM AND LEAVE YOUR FULL NAME, MAILING ADDRESS AND TELEPHONE NUMBER SO WE MAY FORWARD FURTHER INFORMATION AND INSTRUCTIONS TO YOU ABOUT OUR SERVICE.

THE KEY TO ORGANIZING YOUR HEALTH RECORDS

"If you care about yourself and your children, you will do everything you can to know your family's medical history. It can save your life, and the lives of those who are dear to you." -- Dr. Aubry Milunsky, Director, Boston University's Center for Human Genetics (Life Magazine, March, 1995).

Your Lifetime Health Planner offers the simplest, most effective way to take charge of your health. Enter important facts about your health history, keep a record of the names of medications and their effects, document each doctor visit and diagnosis. You will have the information you need, and in the event of an emergency, so will your family.

Your Lifetime Health Planner, 198 pages in a compact, loose-leaf binder, contains a variety of sections which include "Doctor Visits," "Medications," "Family Health History," and "Doctors and Specialists." The Planner is a must for the busy executive who needs to stay organized, for seniors who are receiving care and for newborns who need a record of their health care.

Parents Magazine recommended the Planner to its readers (April, 1994) and MCI called it "a useful resource in managing your personal health records." Margie Smotherman, Coordinator, Employee Health and Wellness, Blue Shield/Blue Cross of Iowa, said: "The employees felt that these (Planners) were great tools to not only record their pertinent numbers, but to plan for doctor's visits."

To get your copy, send a check or money order for $19.95 (plus shipping and handling) to :

Your Lifetime Health Planner

The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while, or be rejected outright.

Sources can be submitted in ASCII form, but for large pacages, a ZOO 2.1 archive encoded using Dumas uuencode is preferred.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. If necessary, I may rewrite or add to this information in order to make the postings to the group more uniform. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected.

THE STRUCTURE OF COMP.SOURCES.ATARI.ST ARTICLES

There are two types of articles in comp.binaries.atari.st: "information postings" and "sources". The source postings are also called "Issues". For a while, 'announcements' were also accepted, but there is now a dedicated group, comp.sys.atari.announce, for that purpose. The type of a posting can be distinguished by the subject line:

```
Subject: v02INF1: Introduction to comp.sources.atari.st
```

This first word in the title identifies this as the first info posting of volume two. Similarly, the subject line shown below:

```
Subject: v06i081: godsrc -- Universe simulator
```

identifies this as the 81st source article in Volume 6. Large sources are broken up into smaller pieces, and have subject lines that look like this:

```
Subject: v06i088: decbustr -- VMS clone in ST-LOGO, Part03/08
```

Certain information about the system configuration required to use the program is given on the keywords line.

```
Keywords: MWC, Megamax, 1meg, high
```

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self- explanatory.

```
Alcyon  - Alcyon C (included with Atari developer's kit)
MWC         - Mark Williams C
Megamax - Megamax C
Laser       - Laser C
Lattice - Lattice C
C       - Any C compiler
OSS         - OSS Personal Pascal
BASIC       - ST BASIC (this is not a joke!)
uuencode    - program is uuencoded (uudecode required to unpack)
arc         - program is archived (arc required to unpack)
zoo-high    - program is archived (Zoo 2.1 required to unpack)
lharc       - program is archived (lharc required to unpack)
high        - high resolution
medium  - medium resolution
low         - low resolution
1meg        - needs 1 meg of RAM
```

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

```
Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 6, Issue 80
Archive-name: micro-rtx
```

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

```
Archive-name: desktop/part01
```

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

HOW TO OBTAIN OLD ISSUES

There is currently no officially documented archive for this group.

This article is posted twice a month. It gives a short introduction to comp.sources.atari.st and describes how to submit

sources or digressions to the group.

I am always looking for suggestions on how to improve the usefulness of the newsgroup, and can be contacted at the following internet address:

   avg@cwi.nl

Annius Groenink, Moderator.

ABOUT comp.sources.atari.st

The moderated usenet group comp.sources.atari.st contains publications or announcements of sources and texts about programming for Atari TOS computers. The publications on comp.sources.atari.st may be freely distributed as long as modifications are documented and the original authors are mentioned.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the instructions below for submitting material intended for publication on comp.sources.atari.st.

SUBMITTING SOURCES OR DIGRESSIONS FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent to avg@cwi.nl. If you are on a UUCP-only site, you can send them to uunet!cwi.nl!avg.

If you want verification of arrival, say so at the beginning of your submission, or in a cover note. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while, or be rejected outright.

Sources can be submitted in ASCII form, but for large pacages, a ZOO 2.1 archive encoded using Dumas uuencode is preferred.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the instructions below for submitting material intended for publication on comp.sources.atari.st.

SUBMITTING SOURCES OR DIGRESSIONS FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent to avg@cwi.nl. If you are on a UUCP-only site, you can send them to uunet!cwi.nl!avg.

If you want verification of arrival, say so at the beginning of your submission, or in a cover note. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while, or be rejected outright.

Sources can be submitted in ASCII form, but for large pacages, a ZOO 2.1 archive encoded using Dumas uuencode is preferred.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. If necessary, I may rewrite or add to this information in order to make the postings to the group more uniform. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected.

THE STRUCTURE OF COMP.SOURCES.ATARI.ST ARTICLES

There are two types of articles in comp.binaries.atari.st: "information postings" and "sources". The source postings are also called "Issues". For a while, 'announcements' were also accepted, but there is now a dedicated group, comp.sys.atari.announce, for that purpose. The type of a posting can be distinguished by the subject line:

```
Subject: v02INF1: Introduction to comp.sources.atari.st
```

This first word in the title identifies this as the first info posting of volume two. Similarly, the subject line shown below:

```
Subject: v06i081: godsrc -- Universe simulator
```

identifies this as the 81st source article in Volume 6. Large sources are broken up into smaller pieces, and have subject lines that look like this:

```
Subject: v06i088: decbustr -- VMS clone in ST-LOGO, Part03/08
```

Certain information about the system configuration required to use the program is given on the keywords line.

```
Keywords: MWC, Megamax, 1meg, high
```

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self- explanatory.

```
Alcyon  - Alcyon C (included with Atari developer's kit)
MWC         - Mark Williams C
Megamax - Megamax C
Laser       - Laser C
Lattice - Lattice C
C       - Any C compiler
OSS         - OSS Personal Pascal
BASIC       - ST BASIC (this is not a joke!)
uuencode    - program is uuencoded (uudecode required to unpack)
arc         - program is archived (arc required to unpack)
zoo-high    - program is archived (Zoo 2.1 required to unpack)
lharc       - program is archived (lharc required to unpack)
high        - high resolution
medium  - medium resolution
low         - low resolution
1meg        - needs 1 meg of RAM
```

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

```
Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 6, Issue 80
Archive-name: micro-rtx
```

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

HOW TO OBTAIN OLD ISSUES

There is currently no officially documented archive for this group.

newsgroups: comp.sources.atari.st

This is an informal `request for discussion' on the moderated Atari news groups

   comp.binaries.atari.st
   comp.sys.atari.st

A moderated news group, as opposed to a regular one such as comp.sys.atari.st, is a news group people can not directly post to---instead a human `moderator' receives all posted articles, and checks their content before they are actually posted.

The Atari binaries/sources news groups were created in times that ftp was not yet very popular, and the world wide web didn't exist; the news was a good way of distributing new software.

The groups are hardly used anymore. Most people prefer to distribute their software through ftp or through their home pages, where they can add as much information as they want, in a pleasant form of presentation.

Here's an indication of what is submitted these days on a MONTHLY basis:

- 2 regular postings at most

- 20 posts saying `what are these groups for?' `where is everybody'?

- 30 advertisements `who wants to buy my racy 520st?'

- 60 spams `100 sexy girls ready at there phones craving for your hard cock'

I therefore propose to permanently delete the groups from usenet. I don't think it is wise to continue the groups as they are now, and frankly not many people will miss them. Instead, one could make their programs available by ftp and post an announcement on one of the other Atari groups, or perhaps, if it is just a small source file, post it directly to comp.sys.atari.st.

I have checked with the authorities, and it doesn't seem necessary for such a low level group to go through a formal voting system. If someone

were to take over the moderation job, they would experience they same problems as I am suffering now, and there simply is no way of improving the situation, nor is there any real need to do so.

Please note that I am not saying that I am looking for a new moderator, but would like to discuss the usefulness of the groups in general.

So, if there are no serious objections, I will request deletion of the groups somewhere early March.

Try to rename to *.prg or *.tos (the usualy atari suffixes).
Maybe it works.
Is the emulator a software or a hardware release ?

The zip files are regular PC or ST zip files... you would need STZip or
PKUNZIP to extract the files inside...

The extenders .prg and .tos are NOT for the 8-bit. Most emulators will
take .atr files, or it is very easy to convert to the other formats.
I have some software (emulators, etc.) available on my Atari site, along
with FAQs and other info on how to use them:
http://infoman.simplenet.com/atari/

hi,

Is there an Atari Web Browser? If so, will it run on an Atari 1040Stf?
TOS 1.0? Where can I get my hands on it? Is it shareware? Commercial?
Please e-mail me with info as I don't get all the newsgroups.

Thanks

Hi,

Keep those offers coming!

Some of you know me. I've bought quite a bit of atari "junk" in the past
two weeks, from complete ST systems to hardware to software. Well, I'm
not done yet. I still need software and I still need an external floppy
for an Atari 1040Stf. I "WILL" buy from the best offers that I receive
so send me your lists and get some money for that junk and regain some
closet space.

Hurry, I won't be buying forever and you'll be stuck with it!

Mykle@con2.com

Mykle schrieb:

M>Is there an Atari Web Browser?

yes, there are two:
1) CAB (from Alexander Clauss, Germany) fine working, together with STIK
2) ??? another one, who just can only read local files and who ist just in a
   early development state.

M>If so, will it run on an Atari 1040Stf?

yes, but 1MByte of RAM is very less!

M>TOS 1.0?

??? i'm not shure... TOS 1.2 (I guess) or better 1.4 (shure) ist preferred.

M>Where can I get my hands on it?

Somewhere in Germany, visit the STIK support page, there is a link.
Or use archie for seraching.

Michael.

A simple way to find it is by visiting the Hensa Archive. they always have the latest version of the program.
The address is not at hand because I've become a platform traitor--the PC is handier but will never replace the Mega for
MIDI.
Resend your question to comp.sys.atari.st and ask for the address. The Hensa archive is pretty comprehensive for Atari
SW and apps. The Usenet group is very very helpful for question and direction.

The .atr files are disk images of old Atari stuff. They are used by
Atari 8-bit emulators, of which I recommend XL-it - it's the best
shareware emulator out there. It's available by link at Yogi's
Jellystone Park at
http:// www.blast.net/~scharles/

Good luck, and have fun!

Recently, there has been a rash of cross-posted discussion articles in alt.binaries.atari. I responded (as moderator) by gently reminding everyone that the newsgroup is NOT for discussion, but only for binaries.

In response, I received rude email from a maus.net user (or possibly 2). Thus, the following new policy is in effect immediately:

Henceforth, ANY AND ALL discussion articles cross-posted to a.b.a will be summarily cancelled. Charter violations will be reported to the appropriate system adminstrators.

I am deliberately cross-posting this warning to all the previously-involved newsgroups. If people would simply read the charter, it wouldn't have been necessary to intrude; to those of you in the majority - that is, courteous and literate users - I apologize. To the one or two of you (who know who you are, at fr.maus.de) who are rude and arrogant, raspberries.

Ich bin auf der Suche nach einem ZCONNECT Modul fuer das Boxprogramm
ALPHABOX.
Gibt es das ? Wenn ja wo kann man es beziehen ?

Antworten bitte NUR in meine PM da ich die Bretter nicht beziehe und
ich nicht fuer mich suche.

i`m searching for the zconnect software for the alphabox bbs software.
anybody knows where can ich get it ?

Hey fragmentk!?! :-) What midi unit? Some midi modules (units?) just
accept sysex as is. Others want to "handshake' with other modules or
computers. My Proteus/1 works with any and all midi programs. But my
Ensoniq SQ-80 needs handshaking and other stuff.

Happy Festivus,
Dave

Greetings!

There was a recently-posted request that
programs should stop after printing text
to the screen (when exiting) so the user
could view the information before the
desktop reappears.

After some toying around with a variety of
commands, I've come up with a fairly-simple
(although heavily commented!) demonstration
function called pause_here(). It won't stop
existing programs, but programmers developing
new software will find this code easy to
implement.

It recognizes any user's keypress (even the
wiseguys who press SHIFT or CONTROL) with the
exception of CAPS LOCK, which apparently only
connects to the IKBD processor and not to the
Central Processing Unit. As a bonus, it will

recognize mouse clicks, as well.

A compiled GEM program containing this
function will be posted as "Two Bit Tutorial
Number 1" (probably in the binaries group)
soon. It will NOT need a resource (*.RSC)
file for proper operation, so don't worry
that it doesn't have one! (You can rename
it PAUSE.TOS, if the lack of a resource
file causes problems.)

GEM programs should _never_ output text directly to the screen, and .TOS programs should _not_ pause after doing text output. This is _very_ annoying for people who use a shell (these people use lots of .TOS and .TTP programs as well). If a program does want to pause, it should definately not circumvent the GEMDOS character input routines, coz' the program's input/output is often redirected into a pipe!
Pause should be handled by whichever program runs the .TOS program, however, the standard desktop isn't that smart...
Maybe a good idea would be to check the extension of the program (in argv[0]) and if it is .tos or .ttp, pause after execution, but if there's no extension (ie. it's probably on a Minix FS) just quit without pause.
Or something like that... :)

: A compiled GEM program containing this
: function will be posted as "Two Bit Tutorial
: Number 1" (probably in the binaries group)
: soon. It will NOT need a resource (*.RSC)
: file for proper operation, so don't worry
: that it doesn't have one! (You can rename
: it PAUSE.TOS, if the lack of a resource
: file causes problems.)

Why would a GEM program want to do text output to the screen anyway?

Very true, but a lot of programs do it anyway --
usually during an initialization failure. The
original request for a TSR program that would
stop the computer AFTER a program exit and BEFORE
the desktop was redisplayed was finally satisfied
with TOSX (Atari GEMINI CD).

> and .TOS programs should _not_ pause after doing

If they print to the screen as they exit, the text
is cleared so quickly that it cannot be read. The
pause is important!

Yep, but the caller application (eg. the desktop) should take care of that
if needed. Unfortunately, as I said before, the GEM Desktop is not very
bright... (replacement desktops usually do have this option)
It may be possible to install a "viewer" program for .TOS and .TTP files
in the DESKTOP.INF. This program could ask for a commandline if needed
(maybe even using XARG, so we can get a decent commandline length!),
run the "client" program with the specified commandline, and pause after the
"client" has quit.

Or use the utility you mentioned. ;-)

Hi there !

I have an ATIN upgrade card (TOS) for my atari 1040.
The only thing that's left to do now is burn the EPROMS

But.... which EPROMS do I need for burning ?
Is there anyone who can send me the program for splitting the ROM image?
(the odd- and even story!)

Please reply to martijn.kruger@solvay.com

Greetings,
Martijn.

The software for Junior Prommer fixes this, and also Pinatubo. I wrote a PRG for this a long time ago, but can't seem to find it. Pinatubo is freeware I believe.

The EPROMs should probably be the 27C010 if your sockets are 32 pin. You can use almost any kind if you care to make extra circuitry. A 74LS139 can split the CE (Chip Enable) signals to drive four, eight or sixteen EPROMs.

Approved: koreth@ssyx.ucsc.edu

Submitted-by: dbrooks@osf.org (David Brooks)
Posting-number: Volume 2, Issue 41
Archive-name: fplib20/part01

This is revision 2.0 of FPLIB, a full floating-point library for use
with Sozobon C on the Atari ST. It fixes some minor bugs in revision
1.0, improves the accuracy and speed of all floating point operations,
and includes better documentation.

X        ==================================
X
X
XNUMBER REPRESENTATION
X---------------------
X
XThe floating point format used is Motorola's "Fast Floating Point":
X
X        ----------------------------------------
X        |    24 bits mantissa    |S| 7 bits exp |
X        ----------------------------------------
X
XThe mantissa has an implicit binary point just off to the left.  The
Xexponent is binary, stored excess-64.  In other words, the actual
Xmathematical exponent has 64 added, and the resulting 7-bit number is
Xunsigned.
X
XNegative numbers are stored as sign-and-magnitude.
X
XAll floating-point operations expect normalized numbers, and generate
Xnormalized numbers if the inputs are normalized.  A number is
Xnormalized if the most significant bit is 1 (except for 0.0, which is
Xstored as 32 bits of zero, never negative).  Also, a nonzero mantissa
Xwith a biased exponent of 0 is not normalized, letting us test the low
Xbyte or whole long as a test for 0.0.  This all means that the most
Xsignificant bit is actually redundant, and could be left off, giving
Xone extra bit of precision.  Oh well.
X
XSome of these routines make use of the assumption that all arguments
```

Xare normalized, and may generate slightly bogus results if that isn't
Xtrue. Release 1.0 assumed that a biased exponent of zero could have
Xa nonzero mantissa; that has been fixed.
X
XSome examples: 1.0 is hex 80000041 , or 0.5 * 2 ** 1 (binary 0.1,
Xexponent 1 + bias of 64). -0.75 is hex C00000C0 (note the sign bit is
Xinverted, but no other bit is).
X
X
XACCURACY AND LIMITS
X------------------
X
XThe accuracy is in the 24-bit mantissa, which gives between 7.22 and
X7.52 decimal digits of relative error. Decimal constants are given to
X8 digits, and the compiler is trusted to convert them right (it
Xgenerally does a reasonable job).
X
XThe range is in the exponent. The smallest nonzero and largest
Xpositive normalized numbers are ~5.4e-20 and ~9.2e18.
X
XRounding of ambiguous numbers uses round-to-even (see D. E. Knuth's
XSeminumerical Algorithms for a discussion on this). This means that
Xif the trailing portion is exactly one half of the least significant
Xbit, the lsb is forced to be the nearer even number. We often keep
Xseveral insignificant bits to be sure this is done correctly.
X
X
XCODING TRICKS
X-------------
X
XIt's quite normal in a library of this type to resort to bit-twiddling
Xin the internal representation. To help this, FPLIB.H defines a C
Xunion, thus:
X
Xunion   {
X   unsigned long ul;
X   float f;
X   char sc[4];
X   };
X
XThe number can be looked at as a floating or integer long (for handling
Xbits in the mantissa), the sign is the sign of sc[3], and the exponent
Xis the rest of sc[3]. Other shortcuts are commented in the inividual
Xroutines.
X
X
XMATHEMATICAL INFORMATION
X------------------------
X
XWell, this is mostly what I remember from my undergraduate days. Many
Xof these functions have a precise mathematical formula or algorithm
Xthat will give the result, but is too slow for practical use. Instead,
Xwe look for an approximation that is quick to compute, and gives us

```
Xjust enough precision and no more.  After all, why compute to 100
Xdigits accuracy when you can only represent less than 8?  Some of these
Xapproximations look very strange, but they all have sound mathematical
Xbases.  The name Chebyshev springs to mind.
X
XDedicated mathematicians have struggled for decades to bring you these
Xformulae and, just as important, a predictable accuracy of better than
X7.5 decimal digits.  Because of this, we can execute a known number of
Xoperations instead of loop-and-test (as you would in, for example, a
Xsimple Newton's iteration for square root).
X
XThe approximations are generally polynomials, usually avoid division, and
Xare valid only over a small range of the input parameter.  We use simple
Xmathematical identities to extend the range.  For example, the cyclic
Xnature of the trigonometric functions means we only need calculate in the
Xrange 0..pi/2.  For another example, we can do much of the square root
Xcalculation by the simple expedient of dividing the binary exponent by 2.
X
X
XRANDOM LIBRARY INFORMATION
X--------------------------
X
XRelease 1.0 of Sozobon C had a few problems in the floating support:
X
X- Two negative floating numbers compared wrong (returned > when it
X  should be <).  I corrected that.  However, the other routines don't
X  assume the correction has been installed in the library (which it
X  wasn't, at first...).
X
X- The library was not optimally ordered, and had to be scanned twice.
X  I straightened that out.
X
X- Add and subtract were truncating.  Rounding is generally a better idea.
X
Xatof() calls sscanf().  Ick.
X
X-------------------------------------------------------------------------------
X
XThese routines may be used without restriction, but I retain the copyright
Xon them, and the Only True Upgrades will be those I make.  If you have any
Ximprovements, please send them to me.

X*
```

```
X* This version works by a normal bitwise shift/subtract loop, with separate
X* handling of the exponent and a final normalization.  26 bits are computed,
X* to allow one normalization and one rounding step.  A certain amount of
X* black magic and handwaving are involved, but please note that at no time
X* do any bits leave the confines of the computer.
X*
X* Round-to-even is used for the ambiguous rounding case.
X*

X         FLOATING POINT LIBRARY FOR SOZOBON C
X
X          Rev 2.0 -- prepared April 30, 1989
X
XThe files contained in this archive are a set of floating point
Xfunctions for Sozobon C.  We provide:
X
X    sqrt      exp       floor
X    sin       sinh      modf
X    cos       cosh      fmod
X    tan       tanh      fabs
X    atan      log       ldexp
X    atan2          log10          frexp
X    asin      pow       atof
X    acos      ceil      math.h
X
Xand modified versions of:
X
X    fpcmp          fpadd          fpmul
X    fpdiv          fp_prt
X
XThese are available in source.  There is also a new LIBM.A that has the
Xnew routines included (and the other routines re-arranged to remove the
Xneed to scan the library twice).
X
XThe complete archive also contains design notes, release notes for
Xrelease 2.0, and a brief set of specifications.
X
XOnly LIBM.A and MATH.H are needed for normal use of the library.
XLIBM.A should go in your LIB directory, and MATH.H in your INCLUDE
Xdirectory.
X
XThese routines may be used without restriction, but I retain the copyright
Xon them, and the Only True Upgrades will be those I make.  If you have any
Ximprovements, please send them to me.

sed 's/^X//' << 'SHAR_EOF' > RNOTES &&
X        Release notes for FPLIB Release 2.0
X        ===================================
X
XThis release contains fixes to FPLIB release 1.0, and fixes to the
Xstandard Sozobon release 1.0 floating support.
X
XIn the standard support:
X
X- The original floating point add/subtract, multiply, and divide have
X  been rewritten for better speed and accuracy.
X
X- Bugs in the floating version of printf have been fixed.
X
XThe remaining information is of interest only if you have been using
XFPLIB release 1.0.  The following changes have been made:
X
X- MATH.H has been expanded to provide symbolic definitions of some
X  common constants.
X
X- A few minor bugs have been fixed:
X
X  * Some routines could return -0.0; the sign has been corrected.
X
X  * Some routines could return a number with a biased exponent of
X    zero; they now return true 0.0.
X
X  * Out of range results are now signaled by ERANGE, not EDOM.
X
X  * frexp() returned an incorrect value on overflow, and ldexp()
X    didn't handle overflow or underflow correctly.
SHAR_EOF
chmod 0600 RNOTES || echo "restore of RNOTES fails"
sed 's/^X//' << 'SHAR_EOF' > SPECS &&
XFPLIB implements the set of routines described in K&R, Second Edition,
Xpp 250-251.  In the following descriptions, x and y are of type float,
Xand n is of type int.  All functions (including ceil and floor) return
Xa value of type float.
X
XRemember to declare any routine you use, either explicitly or by
Xincluding MATH.H.  If you don't, the compiler will assume the function
Xreturns a value of type int, and will perform an unwanted conversion.
X
XA domain error occurs if an argument is outside the range for which
Xthe function is defined (e.g. sqrt(-1.0)).  In this case, errno is
Xset to EDOM and the result is usually 0.0.  A range error occurs if
Xthe result cannot be represented as a float (e.g. exp(100.0)).  In
Xthis case, errno is set to ERANGE and the result is HUGE_VAL.  If the
Xfunction succeeds, errno is not zeroed.
X
```

```
XIn all trigonometric functions, angles are expressed in radians.  Pi
Xradians equal 180 degrees.
X
XAll routines work in all three resolutions :-)
X
Xsin(x)       sine of x.
Xcos(x)       cosine of x.
Xtan(x)       tangent of x.
Xasin(x)      inverse sine of x in the range -pi/2 to pi/2.
Xacos(x)      inverse cosine of x in the range 0 to pi.
Xatan(x)      inverse tangent of x in the range -pi/2 to pi/2.
Xatan2(x,y)   inverse tangent of x/y in the range -pi to pi.  The
X         angle is chosen so that x has the sign of the sine and
X         y has the sign of the cosine.
Xsinh(x)      hyperbolic sine of x.
Xcosh(x)      hyperbolic cosine of x.
Xtanh(x)      hyperbolic tangent of x.
Xexp(x)       e to the power of x.
Xlog(x)       logarithm, base e, of x: x > 0.
Xlog10(x) logarithm, base 10, of x: x > 0.
Xpow(x,y) x to the yth power.  A domain error occurs if x=0 and
X         y<=0, or if x<0 and y is not an integer.
Xsqrt(x)      square root of x: x>=0.
Xceil(x)      smallest whole number not less than x.
Xfloor(x) largest whole number not greater than x.
Xfabs(x)      absolute value of x.
Xldexp(x,n)   x, times 2 to the nth power.
Xfrexp(x,pn)  splits x into a fraction between 0.5 and 0.999..., which
X         is the returned value, and a power of 2, which is stored
X         in the int pointed to by pn.  If x is 0, both parts of
X         the result are 0.
Xmodf(x,py)   splits x into integral and fractional parts, both with
X         the same sign as x.  The fraction is returned and the
X         integral part is stored in the float pointed to by py.
Xfmod(x,y)    remainder of x/y, with the same sign as y.
Xatof(ps) converts the string ps into a float.
X
XThe file MATH.H also defines several mathematical constants.

     Here is the sources version of the DEC keyboard stuff.
If you haven't seen my note with the binary version, please
read that before dealing with this.

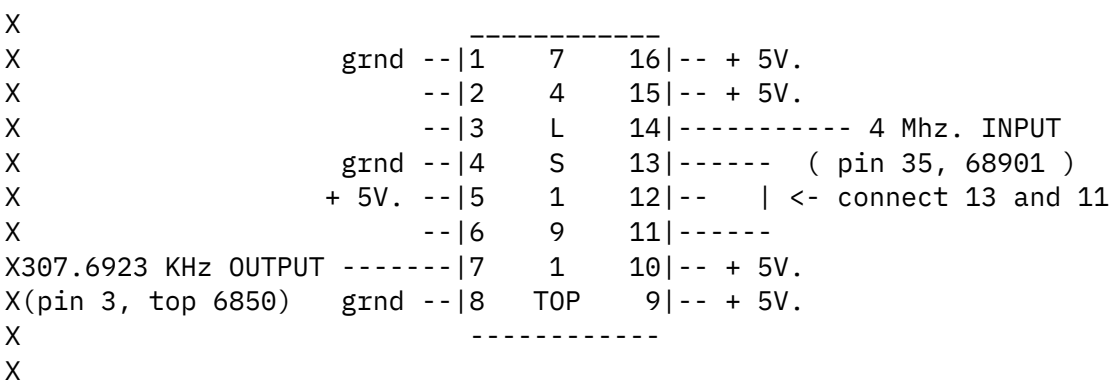
X
XIntroduction:
X
XI'm typing this on a DEC LK201 keyboard connected to an Atari 1040ST
Xthrough the midi port.  Now I won't have to get a Mega to have a
Xdecent, detachable, keyboard!  Besides, this keyboard has a better
Xlayout and ( IMHO ) feel than the one that comes with a Mega.
X
XOne of reason that I started using ST's was that its keyboard layout is
Xalmost identical to a DEC keyboard.  Since my microcomputers spend a lot
Xof time acting as terminals talking to VAX computer systems, the
Xcompatible keyboard layout is very important to me.  On the other hand,
XI have always hated the feel of  the ST keyboard.  I think it is the
XST's worst feature.  Now I have been able to keep the layout and get
Xmuch better feel in a detached keyboard.
X
XLK201s keyboards are used on all current DEC products, including
Xterminals and workstations. Moreover, they were used on the DEC Rainbow
XPC's and on the previous generation of DEC terminals.  As a result,
Xthey are fairly common at ham and computer fests. You could also get a
Xnew one from DEC as a replacement part, albeit for too much money!
X
XThe obvious choice for an external ST keyboard would be an extended PC
Xkeyboard.  Its layout is fairly close to the ST's, and it is relative
Xcheap and very available.  Unfortuately, its electrical interface is
Xquite incompatible with any of the Atari's ports. PC keyboard use with
Xthe ST would require a complicated external interface adapter.  I don't
Xknow if anyone has done it, but I decided it wasn't worth the trouble.
XOn the other hand, the LK201 keyboard can be wired directly to either
```

Xthe serial or midi ports.
X
XLK201s conform to RS-423 standards at 4800 baud, 8 bits, no parity, one
Xstop bit. They send a single byte of code (a scan code) for most key
Xpresses, only the shift and control keys send codes on both down and
Xup. When a key or keys is help down, a metronome (repeat) code is
Xsent at a fixed rate.
X
XThe ST keyboards use a serial interface at 7.8125 K baud. They send a
Xscan code when a key is depressed or released. The software require to
Xconvert input from the DEC keyboard to that used by the ST is straight
Xforward.
X
XIf you are willing to use your serial port, no modifications to the ST
Xor keyboard are required. All it takes is a small, external, power
Xsupply and a RJ11 (modular phone plug) to DB25 adapter. The
Xlimitation when using the serial port is that you can't use the ST as a
Xterminal with the external keyboard. The midi port interface doesn't
Xhave this limitation but it does require internal modifications to the
XST.
X
XThe power supply requirement is 200ma. at 12 V. The voltage is
Xregulated internally so it isn't very critical. A range from 10 V. to
X15 V. seems OK, although you might have internal heat problems in the
Xkeyboard at the upper end of that range. Suitable wall transformer type
Xsupplies are available for less than $10. Since I'm not going to buy a
XMega ST, my ST's power supply will have to handle 4 megabytes of memory
Xin the near future. I didn't want to further load the ST's already
Xmarginal power supply with the extra keyboard.
X
XThe midi port problem is that its baud rate is is hardwired into the
Xcomputer. Changing the midi port's baud rate to 4800 baud is
Xstraightforward, but it should only be done by someone with good
Xsoldering skills and PC (that's Printed Circuit, not Personal
XComputer!) experience.
X
XThe modification uses one TTL IC, half a dozen short pieces of wire,
Xtwo solder connections to pins on existing IC's and one trace cut on
Xthe top of the ST circuit board. It isn't even necessary to remove the
Xmetal shield on a 1040 ST, because everything you need to get at is
Xlocated under the disk drive. Since this change will affect the
Xoperation of the midi port, you may wish to mount a switch (SPDT)
Xthat selects either 4800 or the normal (31.25K)baud rate.
X
XNo external keyboard, unless it is simply an ST keyboard mounted in a
Xseparate case, can replace the built in keyboard. STs need the
Xmouse, joystick, and clock functions of the original keyboard. An
Xexternal keyboard must simply work in parallel with the original
Xkeyboard.
X
XSoftware:
X
XWhen you strike a key on the ST's keyboard, a scancode is sent from it

Xto a serial port on the main board. This causes the serial port to
Xgenerate an interrupt. The interrupt is serviced by a routine that:
X
X   1. Gets the scan code sent by the keyboard
X   2. Determines wether it is dealing with
X   regular keys, shift keys or the mouse
X   3. Performs the appropriate function.
X
XAs a result of a regular key press, the scancode and an ascii code
X(looked up in a set of tables) are placed in a queue. Shift codes
X(right shift, left shift, control, caps lock, and alternate) simply
Xcause a change the contents of a flag byte. The contents of this byte
Xdetermine which of three tables is used for looking up the scan code
Xand if control or ALT are used as modifiers.
X
XAn external keyboard must duplicate, as much as is possible, these
Xregular key and shift functions and not disrupt the other (mouse,
Xclock, and joystick) keyboard functions. Since the builtin keyboard
Xfunctions involve modification of data structures (keyboard queue and
Xshift byte) in memory, the external keyboard software can simply
Xmodify the same data structures. If the keyboard software was not
Xinterrupt driven with these intermediate data stuctures, it would be
Xmuch more dificult to add an external keyboard.
X
XThe serial port, the keyboard port, and the midi port all use similar
Xinterfaces. This makes it easy to write an interrupt handler for the
Xserial or midi port that duplicate the services provide by keyboard
Xport interrupt handler. Most of the needed subroutines are already in
Xthe ST's ROMs. The code needed to add a keyboard is quite small, about
X700 bytes. I'm sending uuencoded sources and binaries to
Xcomp.{sources|binaries}. atari.st.
X
XBugs/Differences from the ST keyboard:
X
XWell this an 'alpha' release, so it probably has a few unintended
X'features'! On the other hand, it is a small, simple, and straight
Xforward program. I have been using the midi version for several weeks
Xon a 1040 ST and a friend has been using the serial port version on a
X520 ST for two weeks. We haven't found any problems.
X
XI did have trouble when I tried using the external keyboard to replace
Xmy mouse buttons. I had to eliminate that 'feature' since it regularly
Xcrashed the ST! The serial version won't work with a screen blanker
Xthat monitors the keyboard/midi interrupt vector since it doesn't use
Xthat vector! The midi version works with idle 1.2, but it must be run
Xbefore idle is run.
X
XI didn't put a lot of effort into handling the alt key because I very
Xrarely use it. On the LK201, the alt key says 'Compose Character' and,
Xbecause of the way I handled it, it only affects the next key pressed.
XThe only program I use that has a problem with alt is Uniterm.
XUnfortunately I use Uniterm more than any other program (thank you
XSimon Poole!). Uniterm doesn't use the normal alt flag, so I just do

Xthe Uniterm alt stuff from my regular keyboard.
X
XThe LK201 keyboard is programmable, but I have not made any use of this
Xfeature. The midi interface is only 'RS423 compatible' for input, so
Xextra hardware would be required there. The serial interface should be
Xable to talk to the keyboard, but I had no luck in my limited attempts
Xto do so. Since I am comfortable with the keyboards default settings,
XI made my interface input only.
X
XNow let's consider the keyboard remappings: There is only one shift
Xcode, so there is no way to set only one of two shift bits. I don't
Xhave any programs that distinguish between the the two shift keys,
Xbut you may. It can't be done with the DEC keyboard. Another DEC
Xlimitation, DEC keyboards don't have a backspace key or an escape
Xkey in the main keypad. I 'fixed' both these problems.
X
XDelete is the key where backspace was and shift-delete acts as
Xbackspace. This works well when I use the ST as a terminal and with
Xemacs like editors. Since some ST programs use backspace as delete
Xleft, I also put backspace and delete on the two extra keys in the
Xmiddle of the pad above the cursor keys.
X
XDEC has this wierd < > key down between the z and the left shift, I
Xmoved ~` down there, and put esc up in the top left hand corner where
X~` was. Note that < and > are shift-, and shift-. respectively.
XActually DEC supports this change in their new 300 series of terminals.
XThey will even sell you a couple of new keytops to make it look
Xpretty. I just marked < and > on the ',' and '.' keycaps.
X
XA few other keys have moved around a bit, but that is about it. There
Xare 20 function keys, so I mapped the top ten to the shifted function
Xkey codes. The keypad is identical, except for the notation on the top
Xfour keys (Pf1 - Pf4 instead of ( ) / *) and the kp+ key that says
X',' . There really is very little difference, and I find no problem,
Xother that feel, in switching between the two keyboards. After typing
Xon the DEC keyboard, the ST feels very bad! Now, on to the hardware
Xdetails.
X
XHardware:
X
XThe RJ11 (standard modular telephone connector) plug on the DEC
Xkeyboard has four wires. They are color coded black, red, green, and
Xyellow. The red wire supplies power (+12 V.) to the keyboard. It
Xshould be connected to the positive side of the power supply. The
Xgreen wire is ground for both the power supply and the communications
Xlines. It must be connnected to the negative side of the power supply.
XThe black wire is the RS-423 output from the keyboard. The yellow wire
Xis the RS-423 input to the keyboard. This interface does not use the
Xyellow wire.
X
XFor the serial port, I used an RJ11 to DB25 adapter that looks like an
Xoversized DB25 shell. Our computer center uses them for all our
Xterminals so that they can use RJ11 wall jacks. I brought the power

Xwires in through a small hole that I melted in the shell, and did all
Xthe wiring inside. There were originally four wires connected to pins
X2, 3, 7, and 20. I cut all the wires and reconnected the ones for 3 (
Xblack wire from keyboard) and 7 (green wire from keyboard and power
Xsupply negative lead). Plug the keyboard into the RJ11 jack.
X
XPlug the DB25 into the serial port, power the keyboard, and run
Xserialkb.prg. Serialkb.prg installs itself as the serial interrupt
Xdriver the first time it is run. It deinstalls itself when it is run
Xagain and restores the original serial port interrupt handler. The
Xsmall amount of memory used (< 1KB) will not be released until you
Xreboot. It will create a new version of itself every other time you
Xrun it.
X
XThe midi port (IN) connector is a five pin DIN male. I actually used
Xthe end of a cable from a defuct IBM PC keyboard. Connect the black
Xwire from the keyboard to pin 4 and the green wire to pin 5. Watch out
Xfor the wierd ordering, it isn't 1 2 3 4 5! The keyboard power
Xconnections are the same as for the serial port (positive voltage to
Xred wire, negative to green). Note that the midi interface is not
XRS-423 compatible, but that a RS-423 output should drive a midi input.
XIt works well on my system, but 'your mileage may vary'. Now lets go
Xthrough the hard part, changing the midi port's baud rate to 4800 baud.
X
XBefore starting this modification, reflect on the fact you will be
Xviolating any Atari warantee and that you could, with suitable
Xcarelessness or ignorance, trash your ST. Don't try this, or any
Xother hardware modification, unless you know what you are doing and
Xare able to handle any damage you may cause. I obviously can't help
Xyou if you damage your system. I hereby disclaim any and all
Xresponsiblility for the correctness of the following instructions.
XYou should assume that they are designed to destroy your system 8^)!
XThese instructions are not a cookbook, they assume that you know
Xwhat you are doing. If you don't, find somebody who does and get
Xthem to help you!
X
XThe midi port uses an ACIA. In its stock form the clock input to the
XACIA is 500 KHz and the ACIA is programmed to divide that clock by 16
Xgiving a 31.25 K baud rate. The keyboard ACIA uses the same clock, but
Xit is programmed to divide it by 64, giving 7.185 K baud. To get 4800
Xbaud we need 16 or 64 times 4800 Hz at the midi ACIA clock input. The
Xsystem has 8, 4, 2, and .5 Mhz clock signal available.
X
XA note of credit here, most of this information and the ROM listings
Xneeded to complete this project came from 'Atari ST Internals',
Xpublished by Abacus. This is, by far, the most useful ST book I own.
X
XA little playing around with a calculator shows 4MHz, divided by 13,
Xthen divided by 64, gives 4807.7 Hz. Good enough! There is a 4 MHz
Xclock input to the 68901 MFP chip which is located near the ACIAs. Now
Xall we need is a ciruit to divide that 4 Mhz clock by thirteen.
X
XDividing a TTL level clock signal by 13 is easy to do with a 4 bit

Xbinary TTL counter chip with a parallel load function. After a little
Xreading in my well worn 'TTL Cookbook' by Don Lancaster, and a few
Xminutes spent sorting through the chips I had available, I came up with
Xthe following circuit:
X
X


grnd --|1 7 16|-- + 5V.
--|2 4 15|-- + 5V.
--|3 L 14|---------- 4 Mhz. INPUT
grnd --|4 S 13|------ (pin 35, 68901)
+ 5V. --|5 1 12|-- | <- connect 13 and 11
--|6 9 11|------
307.6923 KHz OUTPUT -------|7 1 10|-- + 5V.
(pin 3, top 6850) grnd --|8 TOP 9|-- + 5V.
X
XI wired this circuit directly on the pins of the 74LS191 IC using
Xwire-wrap wire. I soldered it after checking to make sure that it
Xdid indeed divide by 13. At first it didn't because I had wired pin
X11 to pin 12, intead of to pin 13! I always check and double check
Xevery step of my work. Careful checking along the way is tedious,
Xbut it prevents much pain and suffering later.
X
X
XNow, for the work inside the ST. Take it apart and remove the floppy
Xdrive (this is for a 1040, I think the relevant chips are located in
Xthe same area on the 520, near the serial port connector, but I
Xhaven't made this modification to a 520. Locate the MFP and the two
XACIAs. On my 1040, the upper (nearest the back) ACIA is used for
Xthe midi port. There is a small trace connecting pins 3 and 4 (the
Xclock inputs) of both ACIA chips. Cut it somewhere between the two
XACIAs. Be careful to completely sever that trace and not to damage
Xany other traces.
X
XTo mount the 74LS191, bend pins 1 and 16 up above the top of the chip
Xand solder them to the leads of a bypass capacitor located above and
Xbetween the ACIA and MFP chips. This holds the chip in place (upside
Xdown) and provides power and ground connections. It is easy to break
Xthe pins, so be gentle. Then carefully connect the INPUT by soldering
Xwire wrap wire directly to pin 35 of the MFP. This pin is located
Ximmediately below the Vss (ground) pin. The ground is easy to
Xidentify because it is a thick trace. Finally, connect the OUTPUT to
Xpin 3 of the midi ACIA using wire wrap wire.
X
XCheck and double check the wiring and the mounting of the TTL IC. Make
Xsure that none of its leads can touch anything conductive, for example,
Xthe bottom shield on the disk drive! Then put it all back together,
Xand boot it. Be prepared to go back inside and fix any errors!
X
XConnect the keyboard to the midi port, power the keyboard, run the
Xprogram midikb.prg, and type on your new keyboard! Midikb installs
Xitself as the midi port interrupt handler. It uses 1 K of memory.
XSince it does not interfere with the normal use of the system (as

```
Xfar as I have been able to determine 8*)), I always have it
Xinstalled, but only power up the keyboard when I am using it.  To
Xdeinstall, you must reboot the system.

Submitted-by: ucsd.edu!cacilj!close (Diane Barlow Close)
Posting-number: Volume 2, Issue 44
Archive-name: djreset

When you turn on your DeskJet Plus printer *after* your ST has been booted,
the printer and the ST won't talk to each other and you can't print
anything.  The only way, until now, of solving this problem was to reboot
the ST (leaving the printer on).

When the printer has been turned on *before* the ST is booted, they will
talk to each other just fine.  As long as you don't turn off (and on again)
your printer, you'll be just fine.  I, for one, don't like to leave my
printer on all the time.  I like to be able to ``compute away'' and turn on
the printer only when I actually need to print something.  So far, with a
DeskJet Plus, this has been impossible.

My husband (Paul Close) and I wrote the following little desk accessory to
``reset'' the printer port and get the DeskJet and the ST talking again.
(That's not exactly what it does, but it's close enough.)  Much thanks to
Moshe Braner for his desk accessory template.

We've included the source code so that you can modify and ``pretty-up'' the
DA to your liking.  Currently it just blinks the screen when a reset is
performed--we didn't add any desktop messages saying ``printer reset'' or
anything like that.

Archive-name: modedit
```

This program can be used to glue your favorite editor into the German Modula-2 system. The program starts the editor named in the environment variable EDITOR, with the cursor enabled. The environment of the parent is passed on as the modula system forgets about it. If more than 1 parameter is given, the first one is the error file, and that file is updated to get the line/char numbers in normal ASCII code.

All this wouldn't be necessary if the Modula2 compiler did it right.

I compiled this with sozobon. [Note: the backslashes in the filename near the top may have to be doubled (like \\) or C may treat them as escapes for the next character in the filename. Dunno what Sozobon does about that. -sg]

Posting-number: Volume 2, Issue 46
Archive-name: overscan

Now here is the program to initialize the BIGSCREEN from the
german magazine 'ST Magazin'. The resolution grows up to
800 * 500. It has to be startet from the 'Auto folder', just
before GEM comes up.  [This is not the same as "bigscrn,"
posted to the binaries group; this requires a hardware
modification. -sg]
```

It patches the basepage adress for the new resolution and
allocates about 69000 Bytes for it.
Also included is (wow!) the C sourcecode (for Megamax C).

```

Submitted-by: 7103_300@uwovax.uwo.ca (Eric R. Smith)
Posting-number: Volume 2, Issue 47
Archive-name: gnutar/part01

   Here is GNU Tar 1.04 ported to TOS. It has all of the
features that are applicable on a single tasking machine;
it can read, write, and create files that are completely
compatible with the Unix tar utility (even the timestamps
are the same). This version is more recent than the one
distributed with the GCC; in particular, a minor bug in
the interpretation of the TZ environment variable is fixed,
and the "stat" function returns more sensible read/write/execute
flags (and can now be used on "." and "..").
   For those not familiar with "tar", it is
an archive utility, widely used on Unix systems. It can
be used to store whole filesystems. Unlike zoo and arc,
it does not do compression; under Unix the "compress"
utility is often applied to tar files, and the same could
easily be done on the ST. GNU tar has a number of extra
features, including the ability to create multi-volume
tar files. The files readme.st and tar.tex in the ARC file
contain more information.
   In accordance with the GNU license, the complete source code
(in C) is included, as well as the executable file gnutar.ttp.
[The binary will appear in comp.binaries.atari.st. -sg]
gnutar was compiled with the GCC v1.34, with the new improved
library (in fact, a newer more improved version :-).

X
X            GNU TAR GENERAL PUBLIC LICENSE
X            (Clarified 11 Feb 1988)
X
X Copyright (C) 1988 Richard M. Stallman
X Everyone is permitted to copy and distribute verbatim copies
X of this license, but changing it is not allowed.  You can also
X use this wording to make the terms for other programs.
X
```

X The license agreements of most software companies keep you at the
Xmercy of those companies. By contrast, our general public license is
Xintended to give everyone the right to share GNU tar. To make sure that
Xyou get the rights we want you to have, we need to make restrictions
Xthat forbid anyone to deny you these rights or to ask you to surrender
Xthe rights. Hence this license agreement.
X
X Specifically, we want to make sure that you have the right to give
Xaway copies of GNU tar, that you receive source code or else can get it
Xif you want it, that you can change GNU tar or use pieces of it in new
Xfree programs, and that you know you can do these things.
X
X To make sure that everyone has such rights, we have to forbid you to
Xdeprive anyone else of these rights. For example, if you distribute
Xcopies of GNU tar, you must give the recipients all the rights that you
Xhave. You must make sure that they, too, receive or can get the
Xsource code. And you must tell them their rights.
X
X Also, for our own protection, we must make certain that everyone
Xfinds out that there is no warranty for GNU tar. If GNU tar is modified by
Xsomeone else and passed on, we want its recipients to know that what
Xthey have is not what we distributed, so that any problems introduced
Xby others will not reflect on our reputation.
X
X Therefore we (Richard Stallman and the Free Software Foundation,
XInc.) make the following terms which say what you must do to be
Xallowed to distribute or change GNU tar.
X
X
X   COPYING POLICIES
X
X 1. You may copy and distribute verbatim copies of GNU tar source code as
Xyou receive it, in any medium, provided that you conspicuously and
Xappropriately publish on each copy a valid copyright notice "Copyright
X(C) 1988 Free Software Foundation, Inc." (or with whatever year is
Xappropriate); keep intact the notices on all files that refer to this
XLicense Agreement and to the absence of any warranty; and give any
Xother recipients of the GNU tar program a copy of this License
XAgreement along with the program. You may charge a distribution
Xfee for the physical act of transferring a copy.
X
X 2. You may modify your copy or copies of GNU tar or any portion of it,
Xand copy and distribute such modifications under the terms of
XParagraph 1 above, provided that you also do the following:
X
X   a) cause the modified files to carry prominent notices stating
X   that you changed the files and the date of any change; and
X
X   b) cause the whole of any work that you distribute or publish,
X   that in whole or in part contains or is a derivative of GNU tar or
X   any part thereof, to be licensed at no charge to all third
X   parties on terms identical to those contained in this License
X   Agreement (except that you may choose to grant more extensive

X   warranty protection to third parties, at your option).
X
X   c) You may charge a distribution fee for the physical act of
X   transferring a copy, and you may at your option offer warranty
X   protection in exchange for a fee.
X
XMere aggregation of another unrelated program with this program (or its
Xderivative) on a volume of a storage or distribution medium does not bring
Xthe other program under the scope of these terms.
X
X 3. You may copy and distribute GNU CC (or a portion or derivative of it,
Xunder Paragraph 2) in object code or executable form under the terms of
XParagraphs 1 and 2 above provided that you also do one of the following:
X
X   a) accompany it with the complete corresponding machine-readable
X   source code, which must be distributed under the terms of
X   Paragraphs 1 and 2 above; or,
X
X   b) accompany it with a written offer, valid for at least three
X   years, to give any third party free (except for a nominal
X   shipping charge) a complete machine-readable copy of the
X   corresponding source code, to be distributed under the terms of
X   Paragraphs 1 and 2 above; or,
X
X   c) accompany it with the information you received as to where the
X   corresponding source code may be obtained. (This alternative is
X   allowed only for noncommercial distribution and only if you
X   received the program in object code or executable form alone.)
X
XFor an executable file, complete source code means all the source code for
Xall modules it contains; but, as a special exception, it need not include
Xsource code for modules which are standard libraries that accompany the
Xoperating system on which the executable file runs.
X
X 4. You may not copy, sublicense, distribute or transfer GNU tar
Xexcept as expressly provided under this License Agreement. Any attempt
Xotherwise to copy, sublicense, distribute or transfer GNU tar is void and
Xyour rights to use the program under this License agreement shall be
Xautomatically terminated. However, parties who have received computer
Xsoftware programs from you with this License Agreement will not have
Xtheir licenses terminated so long as such parties remain in full compliance.
X
X 5. If you wish to incorporate parts of GNU tar into other free
Xprograms whose distribution conditions are different, write to the Free
XSoftware Foundation at 675 Mass Ave, Cambridge, MA 02139. We have not yet
Xworked out a simple rule that can be stated here, but we will often permit
Xthis. We will be guided by the two goals of preserving the free status of
Xall derivatives of our free software and of promoting the sharing and reuse
Xof software.
X
X
XYour comments and suggestions about our licensing policies and our
Xsoftware are welcome! Please contact the Free Software Foundation, Inc.,

X * @(#)open3.h 1.4 87/11/11
X *
X * open3.h -- #defines for the various flags for the Sys V style 3-argument
X * open() call.  On BSD or System 5, the system already has this in an
X * include file.  This file is needed for V7 and MINIX systems for the
X * benefit of open3() in port.c, a routine that emulates the 3-argument
X * call using system calls available on V7/MINIX.
X *
X * This file is needed by PD tar even if we aren't using the
X * emulator, since the #defines for O_WRONLY, etc. are used in
X * a couple of places besides the open() calls, (e.g. in the assignment
X * to openflag in extract.c).  We just #include this rather than
X * #ifdef them out.
X *
X * Written 6/10/87 by rmtodd@uokmax (Richard Todd).
X *
X * The names have been changed by John Gilmore, 31 July 1987, since
X * Richard called it "bsdopen", and really this change was introduced in
X * AT&T Unix systems before BSD picked it up.

X

X/* This version of `getopt' appears to the caller like standard Unix `getopt'
X   but it behaves differently for the user, since it allows the user
X   to intersperse the options with the other arguments.
X
X   As `getopt' works, it permutes the elements of `argv' so that,
X   when it is done, all the options precede everything else.  Thus
X   all application programs are extended to handle flexible argument order.
X
X   Setting the environment variable _POSIX_OPTION_ORDER disables permutation.
X   Then the behavior is completely standard.
X
X   GNU application programs can use a third alternative mode in which
X   they can distinguish the relative order of options and other arguments.  */
X
X#include <stdio.h>
X
X/* For communication from `getopt' to the caller.
X   When `getopt' finds an option that takes an argument,
X   the argument value is returned here.
X   Also, when `ordering' is RETURN_IN_ORDER,
X   each non-option ARGV-element is returned here.  */
X
Xchar *optarg = 0;
X
X/* Index in ARGV of the next element to be scanned.
X   This is used for communication to and from the caller
X   and for communication between successive calls to `getopt'.
X
X   On entry to `getopt', zero means this is the first call; initialize.
X
X   When `getopt' returns EOF, this is the index of the first of the
X   non-option elements that the caller should itself scan.
X
X   Otherwise, `optind' communicates from one call to the next
X   how much of ARGV has been scanned so far.  */
X
Xint optind = 0;
X
X/* The next char to be scanned in the option-element
X   in which the last option character we returned was found.
X   This allows us to pick up the scan where we left off.
X
X   If this is zero, or a null string, it means resume the scan
```

```
X   by advancing to the next ARGV-element.  */
X
Xstatic char *nextchar;
X
X/* Callers store zero here to inhibit the error message
X   for unrecognized options.  */
X
Xint opterr = 1;
X
X/* Describe how to deal with options that follow non-option ARGV-elements.
X
X   UNSPECIFIED means the caller did not specify anything;
X   the default is then REQUIRE_ORDER if the environment variable
X   _OPTIONS_FIRST is defined, PERMUTE otherwise.
X
X   REQUIRE_ORDER means don't recognize them as options.
X   Stop option processing when the first non-option is seen.
X   This is what Unix does.
X
X   PERMUTE is the default.  We permute the contents of `argv' as we scan,
X   so that eventually all the options are at the end.  This allows options
X   to be given in any order, even with programs that were not written to
X   expect this.
X
X   RETURN_IN_ORDER is an option available to programs that were written
X   to expect options and other ARGV-elements in any order and that care about
X   the ordering of the two.  We describe each non-option ARGV-element
X   as if it were the argument of an option with character code zero.
X   Using `-' as the first character of the list of option characters
X   requests this mode of operation.
X
X   The special argument `--' forces an end of option-scanning regardless
X   of the value of `ordering'.  In the case of RETURN_IN_ORDER, only
X   `--' can cause `getopt' to return EOF with `optind' != ARGC.  */

X/* Describe the part of ARGV that contains non-options that have
X   been skipped.  `first_nonopt' is the index in ARGV of the first of them;
X   `last_nonopt' is the index after the last of them.  */
X
Xstatic int first_nonopt;
Xstatic int last_nonopt;
X
X/* Exchange two adjacent subsequences of ARGV.
X   One subsequence is elements [first_nonopt,last_nonopt)
X    which contains all the non-options that have been skipped so far.
X   The other is elements [last_nonopt,optind), which contains all
X    the options processed since those non-options were skipped.
X
```

```
X   `first_nonopt' and `last_nonopt' are relocated so that they describe
X    the new indices of the non-options in ARGV after they are moved.  */
X
Xstatic void
Xexchange (argv)
X     char **argv;
X{
X  int nonopts_size
X    = (last_nonopt - first_nonopt) * sizeof (char *);
X  char **temp = (char **) alloca (nonopts_size);
X
X  /* Interchange the two blocks of data in argv.  */
X
X  bcopy (&argv[first_nonopt], temp, nonopts_size);
X  bcopy (&argv[last_nonopt], &argv[first_nonopt],
X     (optind - last_nonopt) * sizeof (char *));
X  bcopy (temp, &argv[first_nonopt + optind - last_nonopt],
X     nonopts_size);
X
X  /* Update records for the slots the non-options now occupy.  */
X
X  first_nonopt += (optind - last_nonopt);
X  last_nonopt = optind;
X}
X

X/* Scan elements of ARGV (whose length is ARGC) for option characters
X   given in OPTSTRING.
X
X   If an element of ARGV starts with '-', and is not exactly "-" or "--",
X   then it is an option element.  The characters of this element
X   (aside from the initial '-') are option characters.  If `getopt'
X   is called repeatedly, it returns successively each of theoption characters
X   from each of the option elements.
X
X   If `getopt' finds another option character, it returns that character,
X   updating `optind' and `nextchar' so that the next call to `getopt' can
X   resume the scan with the following option character or ARGV-element.
X
X   If there are no more option characters, `getopt' returns `EOF'.
X   Then `optind' is the index in ARGV of the first ARGV-element
X   that is not an option.  (The ARGV-elements have been permuted
X   so that those that are not options now come last.)
X
X   OPTSTRING is a string containing the legitimate option characters.
X   A colon in OPTSTRING means that the previous character is an option
X   that wants an argument.  The argument is taken from the rest of the
X   current ARGV-element, or from the following ARGV-element,
X   and returned in `optarg'.
X
X   If an option character is seen that is not listed in OPTSTRING,
X   return '?' after printing an error message.  If you set `opterr' to
X   zero, the error message is suppressed but we still return '?'.
```

```
X
X   If a char in OPTSTRING is followed by a colon, that means it wants an arg,
X   so the following text in the same ARGV-element, or the text of the following
X   ARGV-element, is returned in `optarg.  Two colons mean an option that
X   wants an optional arg; if there is text in the current ARGV-element,
X   it is returned in `optarg'.
X
X   If OPTSTRING starts with `-', it requests a different method of handling the
X   non-option ARGV-elements.  See the comments about RETURN_IN_ORDER, above.  */

XHere is GNU tar, ported to the Atari ST. The source code is included
X(of course!). See the file "copying" for copyright information.
XPLEASE NOTE: THERE IS ABSOLUTELY NO WARRANTY FOR THIS PRODUCT. USE IT
XAT YOUR OWN RISK!
```

```
X
XAll the changes to the source that were necessary for this version
Xare surrounded by "#ifdef atarist". I used the GCC v1.34, with a new library,
Xto build it. If you're using another compiler, you may need to do some
Xwork. In particular, you'll probably want to add -Datarist to the CFLAGS
Xin the makefile.
X
XRead the enclosed manual (in tar.tex -- actually this should be
Xtar.texinfo, but GEMDOS doesn't know from long extensions) for general
Xinformation.
X
XST-specific information:
X
XTar is designed to run from a command line interpreter,
Xpreferably one that uses the MWC extended argument passing conventions
X(e.g. gulam). You can run it from the desktop if (a) your version of the
Xdesktop will pass lower case letters to programs, and (b) you don't mind
Xmessages disappearing from the screen when the desktop gets redrawn.
X
XThere is no default tar file; one must be explicitly specified on the
Xcommand line. The "-f" option is assumed, i.e typing "tar tv junk.tar"
Xis the same as "tar tvf junk.tar".
X
XSeveral of the options (e.g. -z to compress) are not applicable on the
XST, and will generate error messages.
X
XThe -N option only accepts a date in the form MM/DD/YYYY. (Theoretically,
Xif you have a shell that uses the MWC extended argument passing conventions,
Xyou could use "-NMM/DD/YYY hh:mm:ss" -- make sure you put quotes around
Xit).
X
XTimezones: generally, you will want to tell the program which time zone
Xyou're currently in. To do this, create an environment variable
Xcalled TZ with the format SSS[-]nn[:nn][DDD], (things in [] optional) where
XSSS is the name of your time zone, nn:nn is the offset in hours and minutes
Xfrom GMT (prefixed by '-' if necessary) and DDD, if present, is the name
Xused for your time zone when daylight savings time is in effect. Note
Xthat the rules for daylight savings time are very primitive indeed,
Xand will probably not work outside of North America.
XExample: I'm in the N. American Eastern time zone, and I use (in Gulam)
Xsetenv TZ "EST5EDT".
XIf no TZ environment variable is found, GMT is assumed. This only matters
Xif you're transferring tar files to/from other systems and you want
Xto make sure the dates are correct.
X
XGEMDOS filenames are translated to/from Unix; thus "subdir/file" gets
Xchanged to "subdir\file". This can (obviously) cause problems with GEMDOS
Xfiles which contain '/' in their names, or Unix files that contain '\'.
XWatch out for these. Also, some effort is made to translate names that
Xhave several extensions, e.g. "junk.c.bak" gets mapped to "junk,c.bak".
X
XMulti-volume tar files seem to work, but have not been thoroughly tested.
XI would not recommend using them to back up your hard disk, unless you're
```

```
Xfeeling particularly brave or don't care about your data.
X

XThis manual describes the GNU tape archiver, @code{tar}, and how you
Xcan use it to store copies of a file or a group of files in an
X@dfn{archive}.  This archive may be written directly to a magnetic
Xtape or other storage medium, stored as a file, or sent through a
Xpipe to another program.  @code{tar} can also be used to add files
Xto an already existing archive, list the files in an archive, or
Xextract the files in the archive.
X
XGNU @code{tar} was written by John Gilmore, and modified by many
Xpeople.  The GNU enhancements were written by Jay Fenlason.

X@chapter The Uses of Tape Archives
X
XThe tape archiver @code{tar} allows you to store many files in an
X@dfn{archive file} or @dfn{tar file} which describes the names and contents
Xof the constituent files.  Later you can extract some or all of these files
Xfrom the archive.
X
XTar files are not restricted to magnetic tapes.  The @code{tar} program
Xcan equally well use an ordinary file, or a pipe, or any device, as the
Xarchive.  But they were originally designed for use with magnetic tapes,
Xand that is how the name ``tar'' came about.
X
XArchive files can be used for transporting a group of files from one system
Xto another:  put all relevant files into an archive on one computer system,
Xtransfer the archive to another, and extract the contents there.  The basic
Xtransfer medium might be magnetic tape, Internet FTP, or even electronic
Xmail (though you must encode the archive with @code{uuencode} in order to
Xtransport it properly by mail).  Both machines do not have to use the same
Xoperating system, as long as they both support the @code{tar} program.
X
XA magnetic tape can store several files in sequence, but has no names for
Xthem, just relative position on the tape.  A tar file or something like it
Xis the only way to store several files on one tape and retain their names.
XEven when the basic transfer mechanism can keep track of names, as FTP can,
Xthe nuisance of handling multiple files, directories, and multiple links,
Xmay make a tar file a much easier method.
X
XArchive files are also used for long-term storage, which you can think
Xof as transportation from one time to another.
X
XPiping one @code{tar} to another is an easy way to copy a directory's
Xcontents from one disk to another, while preserving the dates, modes, owners
Xand link-structure of all the files therein.
X
XThe GNU version of @code{tar} has special features that allow it to be
Xused to make incremental and full dumps of all the files in a
Xfilesystem.
X
X@node Commands, Options, Why, Top
X@chapter The Different Operations @code{tar} Can Perform
X
XOne program, @code{tar}, is used to create an archive, to extract files
Xfrom an archive, to modify an archive, or to list the contents.  Each
Xtime you run @code{tar}, you must give a @dfn{command} to specify which
Xone of these things you want to do.
X
XThe command must always be in the first argument to @code{tar}.  This
Xargument can also contain options (@pxref{Options}).  For compatibility
Xwith Unix @code{tar}, the first argument is always treated as containing
```

```
Xcommand and option letters even if it doesn't start with @samp{-}.  Thus,
X@samp{tar c} is equivalent to @samp{tar -c}: both of them specify the
X@samp{-c} command to create an archive.
X
XThe remaining arguments to @code{tar} are either options, if they start
Xwith @samp{-}, or files to operate on.
X
XThe file names that you give as argument are the files that @code{tar} will
Xact on--for example, they are the files to put in the archive, or the files
Xto extract from it.  If you don't give any file name arguments, the default
Xdepends on which command you used.  Some commands use all relevant files;
Xsome commands have no default and will report an error if you don't specify
Xfiles.
X
XIf a file name argument actually names a directory, then that directory
Xand all files and subdirectories in it are used.
X
XHere is a list of all the @code{tar} commands:
X
X@table @samp
X@item -c
XThe @samp{-c} command tells @code{tar} to create a new archive that
Xcontains the file(s) specified on the command line.  If you don't
Xspecify files, all the files in the current directory are used.
X
XIf the archive file already exists, it is overwritten; the old contents
Xare lost.
X
X@item -d
XThe @samp{-d} command causes @code{tar} to compare the archive with
Xthe files in the file system.  It will report differences in file
Xsize, mode, owner, and contents.  If a file exists in the archive, but
Xnot in the file system, @code{tar} will report this.
X
XIf you specify file names, those files are compared with the tape and
Xthey must all exist in the archive.  If you don't specify files, all
Xthe files in the archive are compared.
X
X@item -r
XThe @samp{-r} command causes @code{tar} to add the specified file(s)
Xto the end of the archive.  This assumes that the archive file already
Xexists and is in the proper format (which probably means it was
Xcreated previously with the @code{tar} program).  If the archive is
Xnot in a format that @code{tar} understands, the results will be
Xunpredictable.
X
XYou must specify the files to be used; there is no default.
X
X@item -t
XThe @samp{-t} command causes @code{tar} to display a list of the files
Xin the archive.  If you specify file names, only the files
Xthat you specify will be mentioned (but each of them is mentioned only
Xif it appears in the archive).
```

```
X
X@item -u
XThe @samp{-u} command causes @code{tar} to add the specified files to
Xthe end of the archive, like @w{@samp{-r}}, but only when a file doesn't
Xalready exist in the archive or is newer than the version in the
Xarchive (last-modification time is compared).  This command can be
Xvery slow.
X
XYou must specify the files to be used; there is no default.
X
X@item -x
XThe @samp{-x} command causes @code{tar} to extract the specified files
Xfrom the archive.  If no file names are given, all the files in the
Xarchive will be extracted.
X
X@item -A
XThe @samp{-A} command is used for concatenating several archive files
Xinto one big archive file.  The files to operate on should all be
Xarchive files.  They are all appended to the end of @emph{the} archive
Xfile which @code{tar} works on.  (The other files are not changed).
X
XYou might be tempted to use @code{cat} for this, but it won't
Xordinarily work.  A @code{tar} archive contains data which indicates
Xthe end of the archive, so more material added to the end with
X@code{cat} would be ignored.  The @samp{tar -A} command works because
Xit removes the end-of-archive markers from the middle of the result.
X
X@item -D
XThe @samp{-D} command causes @code{tar} to delete the specified files
Xfrom the archive.  This command is extremely slow.  Warning:  Use of
Xthis command on archives stored on magnetic tape may result in a
Xscrambled archive.  There is no safe way (except for completely
Xre-writing the archive) to delete files from a magnetic tape.
X@end table
X
X@node Options, General Options, Commands, Top
X@chapter Options That Change How @code{tar} Works
X
XOptions may be specified as individual arguments starting with @samp{-}.
XIn this case, if the option wants an argument (as does, for example,
X@samp{-f}) then the argument should come after the option, separated
Xfrom it by a space.
XAll options are optional.  Some options make sense with any command, while
Xothers are meaningful only with particular commands.@refill
X
X@menu
X* General Options::
X* Creation Options::
X* Extraction Options::
X* Option Syntax::
X@end menu
X
X@node General Options, Creation Options, Options, Options
```

```
X@section Options That Are Always Meaningful
X
X@table @code
X@item -b @var{number}
XThis option is used to specify a @dfn{blocking factor} for the
Xarchive.  When reading or writing the archive, @code{tar}, will do
Xreads and writes of the archive in blocks of @var{number}*512 bytes.
X
XThe default blocking factor is set when @code{tar} is compiled, and is
Xtypically 20.
X
XBlocking factors larger than 20 cannot be read by very old versions of
X@code{tar}, or by some newer versions of @code{tar} running on old machines
Xwith small address spaces.
X
XWith a magnetic tape, larger blocks give faster throughput and fit
Xmore data on a tape (because there are fewer inter-record gaps).  If
Xthe archive is in a disk file or a pipe, you may want to specify a
Xsmaller blocking factor, since a large one will result in a large
Xnumber of null bytes at the end of the archive.
X
XWhen writing cartridge or other streaming tapes, a much larger
Xblocking factor (say 126 or more) will greatly increase performance.
XHowever, you must specify the same blocking factor when reading or
Xupdating the archive.
X
XWith GNU @code{tar} the blocking factor is limited only by the maximum
Xblock size of the device containing the archive, or by the amount of
Xavailable virtual memory.
X
X@item -f @var{filename}
XThis option is used to specify the file name of the archive @code{tar}
Xworks on.
X
XIf no @samp{-f} option is given, but the environment variable
X@code{TAPE} exists, its value is used; otherwise, a default archive
Xname (which was picked when @code{tar} was compiled) is used.  The
Xdefault is normally set up to be the ``first'' tape drive or other
Xtransportable I/O medium on the system.
X
XIf the filename is @samp{-}, @code{tar} reads the archive from
Xstandard input (when listing or extracting), or writes it to standard
Xoutput (when creating).  If the @samp{-} filename is given when
Xupdating an archive, @code{tar} will read the original archive from
Xits standard input, and will write the entire new archive to its
Xstandard output.
X
XIf the filename contains @samp{:/dev/}, it is interpreted as
X@samp{hostname:filename}.  If the @var{hostname} contains an ampersand
X(@samp{@@}), it is treated as @samp{user@@hostname:filename}.
XIn either case, @code{tar} will invoke the command @code{rsh}
X(or @code{remsh}) to start
Xup an @code{/etc/rmt} on the remote machine.  If you give an alternate login
```

```
Xname, it will be given to the @code{rsh}.  Naturally, the remote machine must
Xhave a copy of @file{/etc/rmt}.  @code{/etc/rmt} is free software
Xfrom the University of California, and a copy of the source code can be found
Xwith the sources for @code{tar}.  @code{/etc/rmt} will have to be modified to
Xrun on non-BSD4.3 systems.@refill

sed 's/^X//' << 'SHAR_EOF' >> TAR.TEX
X
X@item -C @var{dir}
XThe @samp{-C} option causes @code{tar} to change into the the
```

```
Xdirectory @var{dir} before continuing.  This option is usually
Xinterspersed with the files @code{tar} is to work on.  For example,
X
X@example
Xtar -c iggy ziggy -C baz melvin
X@end example
X
X@noindent
Xwill place the files @file{iggy} and @file{ziggy} from the current
Xdirectory on the tape, followed by the file @file{melvin} from the
Xdirectory @file{baz}.  This option is especially useful when you have
Xseveral widely separated files that you want to store in the same
Xdirectory in the archive.
X
XNote that the file @file{melvin} is recorded in the archive under the
Xprecise name @file{melvin}, @emph{not} @file{baz/melvin}.  Thus, the
Xarchive will contain three files that all appear to have come from the
Xsame directory; if the archive is extracted with plain @samp{tar -x},
Xall three files will be created in the current directory.
X
XContrast this with the command
X
X@example
Xtar -c iggy ziggy bar/melvin
X@end example
X
X@noindent
Xwhich records the third file in the archive under the name @file{bar/melvin}
Xso that, if plain @samp{tar -x} is used, the third file will be created
Xin a subdirectory named @file{bar}.
X
X@item -M
XThe @samp{-M} option causes @code{tar} to write a @dfn{multi-volume}
Xarchive--one that may be larger than will fit on the medium used to
Xhold it.
X
XWhen this option is used, @code{tar} will not abort when it cannot
Xread or write any more data.  Instead, it will ask you to prepare a
Xnew volume.  If the archive is on a magnetic tape, you should change
Xtapes now; if the archive is on a floppy disk, you should change
Xdisks, etc.
X
XEach volume of a multi-volume archive is an independent tar archive,
Xcomplete in itself.  For example, you can list or extract any volume
Xalone (just don't specify @samp{-M}).  However, if one file in the
Xarchive is split across volumes, the only way to extract it
Xsuccessfully is with a multi-volume extract command (@samp{-xM})
Xstarting on or before the volume where the file begins.
X
X@item -N @var{date}
XThis option causes @code{tar} to only work on files whose modification
Xor inode-changed times are newer than the @var{date} given.  The main
Xuse is for creating an archive; then only new files are written.  If
```

```
Xextracting, only newer files are extracted.
X
XRemember that the entire date argument should be quoted if it contains
Xany spaces.
X
XThe date is parsed using @code{getdate}.
X
X@item -R
XIf @samp{-R} is used, @code{tar} prints, along with every message it
Xwould normally produce, the record number within the archive where
Xthe message occurred.  This option is especially useful when reading
Xdamaged archives, since it helps pinpoint the damaged sections.
X
XThis can also be useful when making a log of a file-system backup tape,
Xsince the results allow you to find the file you want to retrieve
Xon several backup tapes and choose the tape where the file appears
Xearliest (closest to the front of the tape).
X
X@item -T @var{filename}
XInstead of taking the list of files to work on from the command
Xline, the list of files to work on is read from the file
X@var{filename}.  If @var{filename} is given as @samp{-}, the list is
Xread from standard input.  Note that using both @samp{-T -} and
X@samp{-f -} will not work unless you are using the @samp{-c} command.
X
X@item -v
XThis option causes @code{tar} to be verbose about the actions it is
Xtaking.
X
XNormally, the @samp{-t} command to list an archive prints
Xjust the file names (one per line) and the other commands are silent.
X
X@samp{-tv} prints a full line of information about each file, like the
Xoutput of @samp{ls -l}.  @samp{-v} with any other command (aside from
X@samp{-t}) prints just the name of each file operated on.
X
XThe output from @samp{-v} appears on the standard output except when
Xcreating or updating an archive to the standard output,
Xin which case the output from @samp{-v} is sent to the standard
Xerror.
X
X@item -version
X
XThis option causes @code{tar} to print out its version number to the
Xstandard error.  In order to avoid being confused with the @samp{-v}
Xoption, @samp{-version} must be given as a separate option,
Xpreceded by a hyphen.
X
X@item -w
XThis option causes @code{tar} to print a message for each action it
Xintends to take, and ask for confirmation on the terminal.  To
Xconfirm, you must type a line of input.  If your input line begins
Xwith @samp{y}, the action is performed, otherwise it is skipped.
```

```
X
XThe actions which require confirmation include adding a file to the
Xarchive, extracting a file from the archive, deleting a file from the
Xarchive, and deleting a file from disk.
X
XIf @code{tar} is reading the archive from the standard input,
X@code{tar} will open the file @file{/dev/tty} to ask for
Xconfirmation on.
X
X@item -X @var{file}
XThis option causes @code{tar} to read a list of filenames
X(actually regular expressions) from the file @var{file};
X@code{tar} will ignore files with those names.
XThus if @code{tar} is called as @samp{tar -c -X foo .}
Xand the file @file{foo} contains @samp{*.o} none of the files
Xwhose names end in @file{.o} in the current directory will be added
Xto the archive.  Multiple @code{-X} options may be given.
X
X@item -z
X@itemx -Z
XThe archive should be compressed as it is written, or decompressed
Xas it is read, using the @code{compress} program.  This option works
Xon physical devices (tape drives, etc.) and remote files as well as
Xon normal files; data to or from such devices or remote files is
Xreblocked by another copy of the @code{tar} program to enforce the
Xspecified (or default) block size.  The default compression
Xparameters are used; if you need to override them, avoid the
X@samp{-z} option and run @code{compress} explicitly.
X
XNote that the @samp{-z} option will not work with the @samp{-M} option,
Xor with the @samp{-u}, @samp{-r}, @samp{-A}, or @samp{-D} commands.
X@end table
X
X@node Creation Options, Extraction Options, General Options, Options
X@section Options for Creating Or Updating an Archive
X
XThese options are used to control which files @code{tar} puts in an
Xarchive, or to control the format the archive is written in (@pxref{Format}).
X
XExcept as noted below, these options are useful with the @samp{-c},
X@samp{-r}, @samp{-u}, @samp{-A}, and @samp{-D} commands.
XAlso note that the @samp{-B} option, (@pxref{Extraction Options}),
Xis also useful with the @samp{-r}, @samp{-u}, @samp{-A}, and @samp{-D} commands.
X
X@table @code
X@c this command no longer exists  -D is now the old -J command
X@c @item -D
X@c The @samp{-D} option tells @code{tar} to only store entries for the
X@c directories it encounters, and to not to store the files inside the
X@c directories.  In conjunction with @code{find} this is useful for
X@c creating incremental dumps for archival backups, similar to those
X@c produced by @code{dump}.
X
```

```
X@item -G
XThis option should only be used when creating an incremental backup of
Xa filesystem.  When the @samp{-G} option is used, @code{tar} writes, at
Xthe beginning of the archive, an entry for each of the directories that
Xwill be operated on.  The entry for a directory includes a list of all
Xthe files in the directory at the time the dump was done, and a flag
Xfor each file indicating whether the file is going to be put in the
Xarchive.  This information is used when doing a complete incremental
Xrestore.
X
XNote that this option causes @code{tar} to create a non-standard
Xarchive that may not be readable by non-GNU versions of the @code{tar}
Xprogram.
X
X@item -h
XIf @samp{-h} is used, when @code{tar} encounters a symbolic link, it
Xwill archive the linked-to file, instead of simply recording the
Xpresence of a symbolic link.  If the linked-to file is archived
Xagain, an entire second copy of it will be archived, instead of a
Xlink.  This could be considered a bug.
X
X@item -l
XThis option causes @code{tar} to not cross filesystem boundaries
Xwhen archiving parts of a directory tree.  This option only
Xaffects files that are archived because they are in a directory that
Xis archived; files named on the command line are archived
Xregardless, and they can be from various file systems.
X
XThis option is useful for making full or incremental archival backups of
Xa file system, as with the Unix @code{dump} command.
X
XFiles which are skipped due to this option are mentioned on the
Xstandard error.
X
X@item -o
XThis option causes @code{tar} to write an old format archive, which
Xdoes not include information about directories, pipes, fifos,
Xcontiguous files, or device files, and specifies file ownership by
Xnumeric user- and group-ids rather than by user and group names.  In
Xmost cases, a @emph{new} format archive can be read by an @emph{old}
X@code{tar} program without serious trouble, so this option should
Xseldom be needed.  When updating an archive, do not use @samp{-o}
Xunless the archive was created with the @samp{-o} option.
X
X@item -V @var{name}
XThis option causes @code{tar} to write out a @dfn{volume header} at
Xthe beginning of the archive.  If @samp{-M} is used, each volume of
Xthe archive will have a volume header of @samp{@var{name} Volume @var{N}},
Xwhere @var{N} is 1 for the first volume, 2 for the next, and so on.
X
X@item -W
XThis option causes @code{tar} to verify the archive after writing it.
XEach volume is checked after it is written, and any discrepancies are
```

```
Xrecorded on the standard error output.
X
XVerification requires that the archive be on a back-space-able medium.
XThis means pipes, some cartridge tape drives, and some other devices
Xcannot be verified.
X@end table
X
X@node Extraction Options, Option Syntax, Creation Options, Options
X@section Options for Listing Or Extracting Files
X
XThe options in this section are meaningful with the @samp{-x} command.
XUnless otherwise stated, they are also meaningful with the @samp{-t}
Xcommand.
X
X@table @code
X@item -B
XIf @samp{-B} is used, @code{tar} will not panic if an attempt to
Xread a block from the archive does not return a full block.  Instead,
X@code{tar} will keep reading until it has obtained a full block.
X
XThis option is turned on by default when @code{tar} is reading an
Xarchive from standard input, or from a remote machine.  This is
Xbecause on BSD Unix systems a read of a pipe will return however much
Xhappens to be in the pipe, even if it is less than @code{tar}
Xrequested.  If this option was not used, @code{tar} would fail
Xas soon as it read an incomplete block from the pipe.
X
XThis option is also useful with the commands for updating an archive.
X
X@item -G
XThe @samp{-G} option means the archive is an incremental backup.
XIts meaning depends on the command that it modifies.
X
XIf the @samp{-G} option is used with @samp{-t}, @code{tar} will list,
Xfor each directory in the archive, the list of files in that
Xdirectory at the time the archive was created.  This information is
Xput out in a format that is not easy for humans to read, but which
Xis unambiguous for a program: each filename is preceded by either a
X@samp{Y} if the file is present in the archive, or an @samp{N} if the
Xfile is a directory, or is not included in the archive.  Each
Xfilename is terminated by a null character.  The last file is
Xfollowed by an additional null and a newline to indicate the end of
Xthe data.
X
XIf the @samp{-G} option is used with @samp{-x}, then when the entry
Xfor a directory is found, all files that currently exist in that directory
Xbut are not listed in the archive @emph{are deleted from the directory}.
X
XThis behavior is convenient when you are restoring a damaged file system
Xfrom a succession of incremental backups: it restores the entire state
Xof the file system to that which obtained when the backup was made.
XIf you don't use @samp{-G}, the file system will probably fill up
Xwith files that shouldn't exist any more.
```

```
X
X@item -i
XThe @samp{-i} option causes @code{tar} to ignore blocks of zeros in the
Xarchive.  Normally a block of zeros indicates the end of the
Xarchive, but when reading a damaged archive, or one which was created by
X@code{cat}-ing several archives together, this option allows
X@code{tar} to read the entire archive.  This option is not on by
Xdefault because many versions of @code{tar} write garbage after the
Xzeroed blocks.
X
XNote that this option causes @code{tar} to read to the end of the
Xarchive file, which may sometimes avoid problems when multiple files
Xare stored on a single physical tape.
X
X@item -k
XThe @samp{-k} option prevents @code{tar} from over-writing existing
Xfiles with files with the same name from the archive.
X
XThe @samp{-k} option is meaningless with @samp{-t}.
X
X@item -K @var{filename}
XThe @samp{-K} option causes @code{tar} to begin extracting or listing
Xthe archive with the file @var{filename}, and to consider only the
Xfiles starting at that point in the archive.  This is useful if a
Xprevious attempt to extract files failed when it reached
X@var{filename} due to lack of free space.  (This assumes, of course,
Xthat there is now free space, or that you are now extracting into a
Xdifferent file system.)
X
X@item -m
XWhen this option is used, @code{tar} leaves the modification times of
Xthe files it extracts as the time when the files were extracted,
Xinstead of setting it to the time recorded in the archive.
X
XThe @samp{-m} option is meaningless with @samp{-t}.
X
X@item -O
XWhen this option is used, instead of creating the files
Xspecified, @code{tar} writes the contents of the files
Xextracted to its standard output.  This may be useful if you
Xare only extracting the files in order to send them through a
Xpipeline.
X
XThe @samp{-O} option is meaningless with @samp{-t}.
X
X@item -p
XThis option causes @code{tar} to set the modes (access permissions) of
Xextracted files exactly as recorded in the archive.  If this option is
Xnot used, the current @code{umask} setting limits the permissions on
Xextracted files.
X
XThe @samp{-p} option is meaningless with @samp{-t}.
X
```

```
X@item -s
XThe @samp{-s} option tells @code{tar} that the list of filenames to be
Xlisted or extracted is sorted in the same order as the files in the
Xarchive.  This allows a large list of names to be used, even on a
Xsmall machine that would not otherwise be able to hold all the names
Xin memory at the same time.  Such a sorted list can easily be created
Xby running @samp{tar -t} on the archive and editing its output.
X
X@samp{-s} is probably never needed on modern computer systems.
X@end table
X
X@node Option Syntax,, Extraction Options, Options
X@section Old Syntax for Options
X
XFor compatibility with Unix @code{tar}, the first argument can contain
Xoption letters in addition to the command letter; for example, @samp{tar
Xcv} specifies the option @samp{-v} in addition to the command @samp{-c}.
XThe first argument to GNU @code{tar} is always treated as command and
Xoption letters even if it doesn't start with @samp{-}.
X
XSome options need their own arguments; for example, @samp{-f} is followed
Xby the name of the archive file.  When the option is given separately, its
Xargument follows it, as is usual for Unix programs.  For example:
X
X@example
Xtar -c -v -b 20 -f /dev/rmt0
X@end example
X
XWhen options that need arguments are given together with the command, all
Xthe associated arguments follow, in the same order as the options.  Thus,
Xthe example above could also be written in the old style as follows:
X
X@example
Xtar cvbf 20 /dev/rmt0
X@end example
X
X@noindent
XHere @samp{20} is the argument of @samp{-b} and @file{/dev/rmt0} is the
Xargument of @samp{-f}.
X
X@node FullDumps, Extraction Options, IncDumps, Top
X@chapter Using @code{tar} to Perform Full Dumps
XFull dumps should only be made when no other people or programs are
Xmodifying files in the filesystem.  If files are modified while
X@code{tar} is making the backup, they may not be stored properly in
Xthe archive, in which case you won't be able to restore them if you
Xhave to.
X
XYou will want to use the @samp{-V} option to give the archive a
Xvolume label, so you can tell what this archive is even if the label
Xfalls off the tape, or anything like that.
X
XUnless the filesystem you are dumping is guaranteed to fit on one
```

```
Xvolume, you will need to use the @samp{-M} option.  Make sure you
Xhave enough tapes on hand to complete the backup.
X
XIf you want to dump each filesystem separately you will need to use
Xthe @samp{-l} option to prevent @code{tar} from crossing filesystem
Xboundaries when storing (sub)directories.
X
XThe @samp{-G} option is not needed, since this is a complete copy of
Xeverything in the filesystem, and a full restore from this backup
Xwould only be done onto a completely empty disk.
X
XUnless you are in a hurry, and trust the @code{tar} program (and
Xyour tapes), it is a good idea to use the @code{-W} (verify) option,
Xto make sure your files really made it onto the dump properly.  This
Xwill also detect cases where the file was modified while (or just
Xafter) it was being archived.
X
X@node IncDumps, FullDumps, Problems, Top
X@chapter Using @code{tar} to Perform Incremental Dumps
XPerforming incremental dumps is similar to performing full dumps,
Xalthough a few more options will usually be needed.
X
XYou will need to use the @samp{-N @var{date}} option to tell @code{tar} to
Xonly store files that have been modified since @var{date}.
X@var{date} should be the date and time of the last full/incremental
Xdump.
X
XA standard scheme is to do a @samp{monthly} (full) dump once a month,
Xa @samp{weekly} dump once a week of everything since the last monthly and
Xa @samp{daily} every day of everything since the last (weekly or monthly)
Xdump.
X
XHere is a copy of the script used to dump the filesystems of the
Xmachines here at the Free Software Foundation.  This script is run
X(semi-)automatically late at night when people are least likely to
Xbe using the machines.  This script dumps several filesystems from
Xseveral machines at once (by using a network-filesystem).  The
Xoperator is responsible for ensuring that all the machines will be
Xup at the time the dump happens.  If a machine is not running, its
Xfiles will not be dumped, and the next day's incremental dump will
X@emph{not} store files that would have gone onto that dump.
X
X@example
X#!/bin/csh
X# Dump thingie
Xset now = `date`
Xset then = `cat date.nfs.dump`
X/u/hack/bin/tar -c -G -v\
X -f /dev/rtu20\
X -b 126\
X -N "$then"\
X -V "Dump from $then to $now"\
X /alpha-bits/gp\
```

```
X /gnu/hack\
X /hobbes/u\
X /spiff/u\
X /sugar-bombs/u
Xecho $now > date.nfs.dump
Xmt -f /dev/rtu20 rew
X@end example
X
XOutput from this script is stored in a file, for the operator to
Xread later.
X
XThis script uses the file @file{date.nfs.dump} to store the date/time of
Xthe last dump.
X
XSince this is a streaming tape drive, no attempt to verify the
Xarchive is done.  This is also why the high blocking factor (126) is
Xused.  The tape drive must also be rewound by the @code{mt} command
Xafter the dump is made.
X
X@node Problems, IncDumps, Format, Top
X@chapter Common Problems Using @code{tar}
X
XIn order to update an archive, @code{tar} must be able to backspace
Xthe archive in order to re-read or re-write a block that was just read
X(or written).  This is currently possible only on two kinds of
Xfiles:  normal disk files (or any other file that can be
Xbackspaced with @code{lseek()}), and industry-standard 9-track magnetic
Xtape (or any other kind of tape that can be backspaced with
X@code{ioctl(@dots{},MTIOCTOP,@dots{})}).
X
XThis means that the @samp{-r}, @samp{-u}, @samp{-A}, and @samp{-D}
Xcommands will not work on any other kind of file.  Some media simply
Xcannot be backspaced, which means these commands and options will
Xnever be able to work on them.  These non-backspacing media include
Xpipes and cartridge tape drives.
X
XSome other media can be backspaced, and @code{tar} will work on them
Xonce it is modified to do so.
X
XArchives created with the @samp{-M}, @samp{-V}, and @samp{-G}
Xoptions may not be readable by other version of @code{tar}.  In particular,
Xrestoring a file that was split over a volume boundary will require
Xsome careful work with @code{dd}, if it can be done at all.  Other versions
Xof @code{tar} may also create an empty file whose name is that of
Xthe volume header.  Some versions of @code{tar} may create normal
Xfiles instead of directories archived with the @samp{-G} option.
X
X@node Rem Tape, IncDumps, Format, Top
X@chapter The Remote Tape Server
XIn order to access the tape drive on a remote machine, @code{tar}
Xuses the remote tape server written at the University of California
Xat Berkeley.  The remote tape server must be installed as
X@file{/etc/rmt} on any machine whose tape drive you want to use.
```

```
X@code{tar} calls @file{/etc/rmt} by running an @code{rsh} or
X@code{remsh} to the remote machine, optionally using a different
Xlogin name if one is supplied.
X
XA copy of the source for the remote tape server is provided.  It is
XCopyright @copyright 1983 by the Regents of the University of California, but
Xcan be freely distributed.  Instructions for compiling and
Xinstalling it are included in the @file{Makefile}.
X
XThe remote tape server may need to be modified in order to run on a
Xnon-4.3BSD system.
X
X@node Format, Rem Tape, , Top
X@chapter The Format of a @code{tar} Archive
XThis chapter is based heavily on John Gilmore's @i{tar}(5) manual page
Xfor the public domain @code{tar} that GNU @code{tar} is based on.
X
X@section The Standard Format
XA @dfn{tar tape} or file contains a series of records.  Each record
Xcontains @code{RECORDSIZE} bytes.  Although this format may be
Xthought of as being on magnetic tape, other media are often used.
X
XEach file archived is represented by a header record which describes
Xthe file, followed by zero or more records which give the contents
Xof the file.  At the end of the archive file there may be a record
Xfilled with binary zeros as an end-of-file marker.  A reasonable
Xsystem should write a record of zeros at the end, but must not
Xassume that such a record exists when reading an archive.
X
XThe records may be @dfn{blocked} for physical I/O operations.  Each
Xblock of @var{N} records (where @var{N} is set by the @samp{-b}
Xoption to @code{tar}) is written with a single @code{write()}
Xoperation.  On magnetic tapes, the result of such a write is a
Xsingle tape record.  When writing an archive, the last block of
Xrecords should be written at the full size, with records after the
Xzero record containing all zeroes.  When reading an archive, a
Xreasonable system should properly handle an archive whose last block
Xis shorter than the rest, or which contains garbage records after a
Xzero record.
X
XThe header record is defined in C as follows:
X
X@example
X/*
X * Standard Archive Format - Standard TAR - USTAR
X */
X#define  RECORDSIZE  512
X#define  NAMSIZ      100
X#define  TUNMLEN      32
X#define  TGNMLEN      32
X
Xunion record @{
X    char        charptr[RECORDSIZE];
```

```
X    struct header @{
X        char    name[NAMSIZ];
X        char    mode[8];
X        char    uid[8];
X        char    gid[8];
X        char    size[12];
X        char    mtime[12];
X        char    chksum[8];
X        char    linkflag;
X        char    linkname[NAMSIZ];
X        char    magic[8];
X        char    uname[TUNMLEN];
X        char    gname[TGNMLEN];
X        char    devmajor[8];
X        char    devminor[8];
X    @} header;
X@};
X
X/* The checksum field is filled with this while the checksum is computed. */
X#define    CHKBLANKS    "        "        /* 8 blanks, no null */
X
X/* The magic field is filled with this if uname and gname are valid. */
X#define    TMAGIC    "ustar  "        /* 7 chars and a null */
X
X/* The magic field is filled with this if this is a GNU format dump entry */
X#define    GNUMAGIC  "GNUtar "        /* 7 chars and a null */
X
X/* The linkflag defines the type of file */
X#define  LF_OLDNORMAL '\0'       /* Normal disk file, Unix compatible */
X#define  LF_NORMAL    '0'        /* Normal disk file */
X#define  LF_LINK      '1'        /* Link to previously dumped file */
X#define  LF_SYMLINK   '2'        /* Symbolic link */
X#define  LF_CHR       '3'        /* Character special file */
X#define  LF_BLK       '4'        /* Block special file */
X#define  LF_DIR       '5'        /* Directory */
X#define  LF_FIFO      '6'        /* FIFO special file */
X#define  LF_CONTIG    '7'        /* Contiguous file */
X
X/* Further link types may be defined later. */
X
X/* Bits used in the mode field - values in octal */
X#define  TSUID    04000        /* Set UID on execution */
X#define  TSGID    02000        /* Set GID on execution */
X#define  TSVTX    01000        /* Save text (sticky bit) */
X
X/* File permissions */
X#define  TUREAD   00400        /* read by owner */
X#define  TUWRITE  00200        /* write by owner */
X#define  TUEXEC   00100        /* execute/search by owner */
X#define  TGREAD   00040        /* read by group */
X#define  TGWRITE  00020        /* write by group */
X#define  TGEXEC   00010        /* execute/search by group */
X#define  TOREAD   00004        /* read by other */
```

```
X#define  TOWRITE  00002        /* write by other */
X#define  TOEXEC   00001        /* execute/search by other */
X@end example
X
XAll characters in header records are represented by using 8-bit
Xcharacters in the local variant of ASCII.  Each field within the
Xstructure is contiguous; that is, there is no padding used within
Xthe structure.  Each character on the archive medium is stored
Xcontiguously.
X
XBytes representing the contents of files (after the header record of
Xeach file) are not translated in any way and are not constrained to
Xrepresent characters in any character set.  The @code{tar} format
Xdoes not distinguish text files from binary files, and no
Xtranslation of file contents is performed.
X
XThe @code{name}, @code{linkname}, @code{magic}, @code{uname}, and
X@code{gname} are null-terminated character strings.  All other
Xfileds are zero-filled octal numbers in ASCII.  Each numeric field
Xof width @var{w} contains @var{w}@minus 2 digits, a space, and a null,
Xexcept @code{size}, and @code{mtime}, which do not contain the
Xtrailing null.
X
XThe @code{name} field is the pathname of the file, with directory
Xnames (if any) preceding the file name, separated by slashes.
X
XThe @code{mode} field provides nine bits specifying file permissions
Xand three bits to specify the Set UID, Set GID, and Save Text
X(``stick'') modes.  Values for these bits are defined above.  When
Xspecial permissions are required to create a file with a given mode,
Xand the user restoring files from the archive does not hold such
Xpermissions, the mode bit(s) specifying those special permissions
Xare ignored.  Modes which are not supported by the operating system
Xrestoring files from the archive will be ignored.  Unsupported modes
Xshould be faked up when creating or updating an archive; e.g. the
Xgroup permission could be copied from the @code{other} permission.
X
XThe @code{uid} and @code{gid} fields are the numeric user and group
XID of the file owners, respectively.  If the operating system does
Xnot support numeric user or group IDs, these fields should be
Xignored.
X
XThe @code{size} field is the size of the file in bytes; linked files
Xare archived with this field specified as zero.
X@xref{Extraction Options}; in particular the @samp{-G} option.@refill
X
XThe @code{mtime} field is the modification time of the file at the
Xtime it was archived.  It is the ASCII representation of the octal
Xvalue of the last time the file was modified, represented as an
Xinteger number of seconds since January 1, 1970, 00:00 Coordinated
XUniversal Time.
X
XThe @code{chksum} field is the ASCII representation of the octal
```

```
Xvalue of the simple sum of all bytes in the header record.  Each
X8-bit byte in the header is added to an unsigned integer,
Xinitialized to zero, the precision of which shall be no less than
Xseventeen bits.  When calculating the checksum, the @code{chksum}
Xfield is treated as if it were all blanks.
X
XThe @code{typeflag} field specifies the type of file archived.  If a
Xparticular implementation does not recognize or permit the specified
Xtype, the file will be extracted as if it were a regular file.  As
Xthis action occurs, @code{tar} issues a warning to the standard
Xerror.
X
X@table @code
X@item LF_NORMAL
X@itemx LF_OLDNORMAL
XThese represent a regular file.  In order to be compatible with
Xolder versions of @code{tar}, a @code{typeflag} value of
X@code{LF_OLDNORMAL} should be silently recognized as a regular
Xfile.  New archives should be created using @code{LF_NORMAL}.  Also,
Xfor backward compatibility, @code{tar} treats a regular file whose
Xname ends with a slash as a directory.
X
X@item LF_LINK
XThis represents a file linked to another file, of any type,
Xpreviously archived.  Such files are identified in Unix by each file
Xhaving the same device and inode number.  The linked-to
Xname is specified in the @code{linkname} field with a trailing null.
X
X@item LF_SYMLINK
XThis represents a symbolic link to another file.  The linked-to
Xname is specified in the @code{linkname} field with a trailing null.
X
X@item LF_CHR
X@itemx LF_BLK
XThese represent character special files and block special files
Xrespectively.  In this case the @code{devmajor} and @code{devminor}
Xfields will contain the major and minor device numbers
Xrespectively.  Operating systems may map the device specifications
Xto their own local specification, or may ignore the entry.
X
X@item LF_DIR
XThis specifies a directory or sub-directory.  The directory name in
Xthe @code{name} field should end with a slash.  On systems where
Xdisk allocation is performed on a directory basis the @code{size}
Xfield will contain the maximum number of bytes (which may be rounded
Xto the nearest disk block allocation unit) which the directory may
Xhold.  A @code{size} field of zero indicates no such limiting.
XSystems which do not support limiting in this manner should ignore
Xthe @code{size} field.
X
X@item LF_FIFO
XThis specifies a FIFO special file.  Note that the archiving of a
XFIFO file archives the existence of this file and not its contents.
```

```
X
X@item LF_CONTIG
XThis specifies a contiguous file, which is the same as a normal
Xfile except that, in operating systems which support it,
Xall its space is allocated contiguously on the disk.  Operating
Xsystems which do not allow contiguous allocation should silently treat
Xthis type as a normal file.
X
X@item 'A' @dots{}
X@itemx 'Z'
XThese are reserved for custom implementations.  Some of these are
Xused in the GNU modified format, as described below.
X@end table
X
XOther values are reserved for specification in future revisions of
Xthe P1003 standard, and should not be used by any @code{tar} program.
X
XThe @code{magic} field indicates that this archive was output in the
XP1003 archive format.  If this field contains @code{TMAGIC}, the
X@code{uname} and @code{gname} fields will contain the ASCII
Xrepresentation of the owner and group of the file respectively.  If
Xfound, the user and group ID represented by these names will be used
Xrather than the values within the @code{uid} and @code{gid} fields.
X
X@section GNU Extensions to the Archive Format
XThe GNU format uses additional file types to describe new types of
Xfiles in an archive.  These are listed below.
X
X@table @code
X@item LF_DUMPDIR
X@itemx 'D'
XThis represents a directory and a list of files created by the
X@samp{-G} option.  The @code{size} field gives the total size of the
Xassociated list of files.  Each filename is preceded by either a @code{'Y'}
X(the file should be in this archive) or an @code{'N'} (The file is a
Xdirectory, or is not stored in the archive).  Each filename is
Xterminated by a null.  There is an additional null after the last
Xfilename.
X
X@item LF_MULTIVOL
X@itemx 'M'
XThis represents a file continued from another volume of a
Xmulti-volume archive created with the @samp{-M} option.  The original
Xtype of the file is not given here.  The @code{size} field gives the
Xmaximum size of this piece of the file (assuming the volume does not
Xend before the file is written out).  The @code{offset} field gives
Xthe offset from the beginning of the file where this part of the
Xfile begins.  Thus @code{size} plus @code{offset} should equal the
Xoriginal size of the file.
X
X@item LF_VOLHDR
X@itemx 'V'
XThis file type is used to mark the volume header that was given with
```

```
Xthe @samp{-V} option when the archive was created.  The @code{name}
Xfield contains the @code{name} given after the @samp{-V} option.
XThe @code{size} field is zero.  Only the first file in each volume
Xof an archive should have this type.
X
X@end table
X
XYou may have trouble reading a GNU format archive on a non-GNU system
Xif the options @samp{-G}, @samp{-M} or @samp{-V} were used when writing
Xthe archive.
X@unnumbered Concept Index
X@printindex cp

XFrom: rs@mirror.TMC.COM (Rich Salz)
XNewsgroups: net.sources
XSubject: Small shell-style pattern matcher
XMessage-ID: <596@mirror.TMC.COM>
XDate: 27 Nov 86 00:06:40 GMT
X
XThere have been several regular-expression subroutines and one or two
Xfilename-globbing routines in mod.sources.  They handle lots of
Xcomplicated patterns.  This small piece of code handles the *?[]\
Xwildcard characters the way the standard Unix(tm) shells do, with the
Xaddition that "[^.....]" is an inverse character class -- it matches
Xany character not in the range ".....".  Read the comments for more
Xinfo.
X
XFor my application, I had first ripped off a copy of the "glob" routine
```

```
Xfrom within the find(1) source, but that code is bad news:  it recurses
Xon every character in the pattern.  I'm putting this replacement in the
Xpublic domain.  It's small, tight, and iterative.  Compile with -DTEST
Xto get a test driver.  After you're convinced it works, install in
Xwhatever way is appropriate for you.
X
XI would like to hear of bugs, but am not interested in additions; if I
Xwere, I'd use the code I mentioned above.
X*/
X/*
X**  Do shell-style pattern matching for ?, \, [], and * characters.
X**  Might not be robust in face of malformed patterns; e.g., "foo[a-"
X**  could cause a segmentation violation.
X**
X**  Written by Rich $alz, mirror!rs, Wed Nov 26 19:03:17 EST 1986.
X*/
X
X/*
X * Modified 6Nov87 by John Gilmore (hoptoad!gnu) to return a "match"
X * if the pattern is immediately followed by a "/", as well as \0.
X * This matches what "tar" does for matching whole subdirectories.
X *
X * The "*" code could be sped up by only recursing one level instead
X * of two for each trial pattern, perhaps, and not recursing at all
X * if a literal match of the next 2 chars would fail.

Approved: koreth%panarthea.ebay@sun.com

Submitted-by: uunet!unido!sbsvax!roeder (Edgar Roeder)
Posting-number: Volume 2, Issue 56
Archive-name: gccgem/part01

This is the long awaited GEM library for GNU C. This code would also work
for other C-compilers. Watch out for the inline assembler statements in
gem-guts.h. You may need to replace them by whatever your compiler supports.

I am posting this for a friend who has no access to the net.
If there are any questions mail to me at roeder@sbsvax.uucp and i will
forward them to him.

[I repackaged this, as the original submission was in 60K-parts. -sg]

- Edgar

X
X            GNU GENERAL PUBLIC LICENSE
X             Version 1, February 1989
X
X Copyright (C) 1989 Free Software Foundation, Inc.
X                    675 Mass Ave, Cambridge, MA 02139, USA
X Everyone is permitted to copy and distribute verbatim copies
X of this license document, but changing it is not allowed.
X
X                Preamble
X
X  The license agreements of most software companies try to keep users
Xat the mercy of those companies.  By contrast, our General Public
XLicense is intended to guarantee your freedom to share and change free
Xsoftware--to make sure the software is free for all its users.  The
XGeneral Public License applies to the Free Software Foundation's
Xsoftware and to any other program whose authors commit to using it.
XYou can use it for your programs, too.
X
X  When we speak of free software, we are referring to freedom, not
Xprice.  Specifically, the General Public License is designed to make
Xsure that you have the freedom to give away or sell copies of free
Xsoftware, that you receive source code or can get it if you want it,
Xthat you can change the software or use pieces of it in new free
Xprograms; and that you know you can do these things.
X
X  To protect your rights, we need to make restrictions that forbid
Xanyone to deny you these rights or to ask you to surrender the rights.
XThese restrictions translate to certain responsibilities for you if you
Xdistribute copies of the software, or if you modify it.
X
X  For example, if you distribute copies of a such a program, whether
```

Xgratis or for a fee, you must give the recipients all the rights that
Xyou have. You must make sure that they, too, receive or can get the
Xsource code. And you must tell them their rights.
X
X We protect your rights with two steps: (1) copyright the software, and
X(2) offer you this license which gives you legal permission to copy,
Xdistribute and/or modify the software.
X
X Also, for each author's protection and ours, we want to make certain
Xthat everyone understands that there is no warranty for this free
Xsoftware. If the software is modified by someone else and passed on, we
Xwant its recipients to know that what they have is not the original, so
Xthat any problems introduced by others will not reflect on the original
Xauthors' reputations.
X
X The precise terms and conditions for copying, distribution and
Xmodification follow.
X

X   GNU GENERAL PUBLIC LICENSE
X   TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION
X
X 0. This License Agreement applies to any program or other work which
Xcontains a notice placed by the copyright holder saying it may be
Xdistributed under the terms of this General Public License. The
X"Program", below, refers to any such program or work, and a "work based
Xon the Program" means either the Program or any work containing the
XProgram or a portion of it, either verbatim or with modifications. Each
Xlicensee is addressed as "you".
X
X 1. You may copy and distribute verbatim copies of the Program's source
Xcode as you receive it, in any medium, provided that you conspicuously and
Xappropriately publish on each copy an appropriate copyright notice and
Xdisclaimer of warranty; keep intact all the notices that refer to this
XGeneral Public License and to the absence of any warranty; and give any
Xother recipients of the Program a copy of this General Public License
Xalong with the Program. You may charge a fee for the physical act of
Xtransferring a copy.
X
X 2. You may modify your copy or copies of the Program or any portion of
Xit, and copy and distribute such modifications under the terms of Paragraph
X1 above, provided that you also do the following:
X
X   a) cause the modified files to carry prominent notices stating that
X   you changed the files and the date of any change; and
X
X   b) cause the whole of any work that you distribute or publish, that
X   in whole or in part contains the Program or any part thereof, either
X   with or without modifications, to be licensed at no charge to all
X   third parties under the terms of this General Public License (except
X   that you may choose to grant warranty protection to some or all
X   third parties, at your option).
X

X   c) If the modified program normally reads commands interactively when
X   run, you must cause it, when started running for such interactive use
X   in the simplest and most usual way, to print or display an
X   announcement including an appropriate copyright notice and a notice
X   that there is no warranty (or else, saying that you provide a
X   warranty) and that users may redistribute the program under these
X   conditions, and telling the user how to view a copy of this General
X   Public License.
X
X   d) You may charge a fee for the physical act of transferring a
X   copy, and you may at your option offer warranty protection in
X   exchange for a fee.
X
XMere aggregation of another independent work with the Program (or its
Xderivative) on a volume of a storage or distribution medium does not bring
Xthe other work under the scope of these terms.
X

X 3. You may copy and distribute the Program (or a portion or derivative of
Xit, under Paragraph 2) in object code or executable form under the terms of
XParagraphs 1 and 2 above provided that you also do one of the following:
X
X   a) accompany it with the complete corresponding machine-readable
X   source code, which must be distributed under the terms of
X   Paragraphs 1 and 2 above; or,
X
X   b) accompany it with a written offer, valid for at least three
X   years, to give any third party free (except for a nominal charge
X   for the cost of distribution) a complete machine-readable copy of the
X   corresponding source code, to be distributed under the terms of
X   Paragraphs 1 and 2 above; or,
X
X   c) accompany it with the information you received as to where the
X   corresponding source code may be obtained. (This alternative is
X   allowed only for noncommercial distribution and only if you
X   received the program in object code or executable form alone.)
X
XSource code for a work means the preferred form of the work for making
Xmodifications to it. For an executable file, complete source code means
Xall the source code for all modules it contains; but, as a special
Xexception, it need not include source code for modules which are standard
Xlibraries that accompany the operating system on which the executable
Xfile runs, or for standard header files or definitions files that
Xaccompany that operating system.
X
X 4. You may not copy, modify, sublicense, distribute or transfer the
XProgram except as expressly provided under this General Public License.
XAny attempt otherwise to copy, modify, sublicense, distribute or transfer
Xthe Program is void, and will automatically terminate your rights to use
Xthe Program under this License. However, parties who have received
Xcopies, or rights to use copies, from you under this General Public
XLicense will not have their licenses terminated so long as such parties
Xremain in full compliance.

X
X 5. By copying, distributing or modifying the Program (or any work based
Xon the Program) you indicate your acceptance of this license to do so,
Xand all its terms and conditions.
X
X 6. Each time you redistribute the Program (or any work based on the
XProgram), the recipient automatically receives a license from the original
Xlicensor to copy, distribute or modify the Program subject to these
Xterms and conditions. You may not impose any further restrictions on the
Xrecipients' exercise of the rights granted herein.
X

X 7. The Free Software Foundation may publish revised and/or new versions
Xof the General Public License from time to time. Such new versions will
Xbe similar in spirit to the present version, but may differ in detail to
Xaddress new problems or concerns.
X
XEach version is given a distinguishing version number. If the Program
Xspecifies a version number of the license which applies to it and "any
Xlater version", you have the option of following the terms and conditions
Xeither of that version or of any later version published by the Free
XSoftware Foundation. If the Program does not specify a version number of
Xthe license, you may choose any version ever published by the Free Software
XFoundation.
X
X 8. If you wish to incorporate parts of the Program into other free
Xprograms whose distribution conditions are different, write to the author
Xto ask for permission. For software which is copyrighted by the Free
XSoftware Foundation, write to the Free Software Foundation; we sometimes
Xmake exceptions for this. Our decision will be guided by the two goals
Xof preserving the free status of all derivatives of our free software and
Xof promoting the sharing and reuse of software generally.
X
X   NO WARRANTY
X
X 9. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY
XFOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN
XOTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES
XPROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED
XOR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF
XMERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS
XTO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE
XPROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING,
XREPAIR OR CORRECTION.
X
X 10. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING
XWILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR
XREDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES,
XINCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING
XOUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED
XTO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY
XYOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER
XPROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE

XPOSSIBILITY OF SUCH DAMAGES.
X
X   END OF TERMS AND CONDITIONS
X

X   Appendix: How to Apply These Terms to Your New Programs
X
X If you develop a new program, and you want it to be of the greatest
Xpossible use to humanity, the best way to achieve this is to make it
Xfree software which everyone can redistribute and change under these
Xterms.
X
X To do so, attach the following notices to the program. It is safest to
Xattach them to the start of each source file to most effectively convey
Xthe exclusion of warranty; and each file should have at least the
X"copyright" line and a pointer to where the full notice is found.
X
X   <one line to give the program's name and a brief idea of what it does.>
X   Copyright (C) 19yy <name of author>
X
X   This program is free software; you can redistribute it and/or modify
X   it under the terms of the GNU General Public License as published by
X   the Free Software Foundation; either version 1, or (at your option)
X   any later version.
X
X   This program is distributed in the hope that it will be useful,
X   but WITHOUT ANY WARRANTY; without even the implied warranty of
X   MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
X   GNU General Public License for more details.
X
X   You should have received a copy of the GNU General Public License
X   along with this program; if not, write to the Free Software
X   Foundation, Inc., 675 Mass Ave, Cambridge, MA 02139, USA.
X
XAlso add information on how to contact you by electronic and paper mail.
X
XIf the program is interactive, make it output a short notice like this
Xwhen it starts in an interactive mode:
X
X   Gnomovision version 69, Copyright (C) 19xx name of author
X   Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
X   This is free software, and you are welcome to redistribute it
X   under certain conditions; type `show c' for details.
X
XThe hypothetical commands `show w' and `show c' should show the
Xappropriate parts of the General Public License. Of course, the
Xcommands you use may be called something other than `show w' and `show
Xc'; they could even be mouse-clicks or menu items--whatever suits your
Xprogram.
X
XYou should also get your employer (if you work as a programmer) or your
Xschool, if any, to sign a "copyright disclaimer" for the program, if
Xnecessary. Here a sample; alter the names:

```
X
X  Yoyodyne, Inc., hereby disclaims all copyright interest in the
X  program `Gnomovision' (a program to direct compilers to make passes
X  at assemblers) written by James Hacker.
X
X  <signature of Ty Coon>, 1 April 1989
X  Ty Coon, President of Vice
X
XThat's all there is to it!
SHAR_EOF
chmod 0644 COPYING || echo "restore of COPYING fails"
echo "x - extracting README (Text)"
sed 's/^X//' << 'SHAR_EOF' > README &&
XI am posting this for a friend who has no access to the net. He has hacked in
Xmost of the VDI and AES functions used on the ST. If there are any questions
Xmail to me at roeder@sbsvax.uucp and i will forward them to him.
X
XThis library may be distributed under the terms of the GNU General Public
XLicence which can be found in the file COPYING.

Submitted-by: Thomas_E_Zerucha@cup.portal.com (Thomas E. Zerucha)
Posting-number: Volume 2, Issue 64
Archive-name: environ

Environ.prg is a program to set the desktop's environment from the auto
folder using a text file (environ.dat) in the root directory of your boot
disk. This way you can have your environment set for your shell without
long profiles or logins, and can put .rsc files where they can always be
found (on another drive).

```
#!/bin/sh
# shar:  Shell Archiver  (v1.22)
#
#    Run the following text with /bin/sh to create:
#      ENVIRON.DAT
#      ENVIRON.DOC
#      ENVIRON.S
#
sed 's/^X//' << 'SHAR_EOF' > ENVIRON.DAT &&
XPATH=;d:\gemprogs;d:;d:\bin;d:\lang;d:\scripts;d:\usrbin;.
XTEMP=c:\tmp\
XINCLUDE=d:\include\
XSYMB=d:\lang\
XLIB=d:\lib\
XSTARTUP=d:\lib\gemstart
XRUNTIME=d:\lib\gemlib
XSUFF=,.prg,.ttp,.tos
XLIBPATH=d:\mwlib,d:\lang,.
XINCDIR=d:\mwinc\
XTMPDIR=c:\tmp\
XTIMEZONE=EST:0:EDT
XEDITOR=sedt.ttp
XSEDT=d:\include\
XSHELL=csh.tos
```

```
XHOME=d:\
SHAR_EOF
chmod 0644 ENVIRON.DAT || echo "restore of ENVIRON.DAT fails"
sed 's/^X//' << 'SHAR_EOF' > ENVIRON.DOC &&
XENVIRON.PRG
X - set desktop environment (like PATH, HOME, and other things for shells)
X from \AUTO folder.
X
X    Place ENVIRON.PRG in the \AUTO folder.
X
X    Uses ENVIRON.DAT as a standard ASCII text file containing the
X    environment (e.g try "printenv >c:\environ.dat" and use that
X    after fixing the PATH= as shown below).
X
X    Note that GEM can find .RSC files on the first entry in the path,
X    but ignores the first character, e.g. the following works:
X
XNote | the extra semicolon, and that you need semicolons and not commas
X     |         for the PATH to work for the desktop and .rsc files.
X     v
XPATH=;d:\gemprogs;d:;d:\bin;d:\lang;d:\scripts;d:\usrbin;.
XTEMP=c:\tmp\
XINCLUDE=d:\include\
X
X    All my .rsc files (and some configs and such) are in my d:\gemprogs,
X    so I can double click a document (installed as per the desktop
X    dialog, e.g. .DOC=1stword) anywhere on any disk and the program
X    will come up properly, and I can go "gem program doc" from any
X    folder under a shell and everything will work.
X
X    (Tech note: It is documented somewhere that the way GEM searches
X    for the .RSC files (and there is a call that looks for files
X    in the same way for setups, etc.) is to first search the current
X    directory, then the root directory on the disk, then the PATH=
X    value, which defaults to A:, which is why it spins your floppy
X    before it says it can't find the resource.  What my program does
X    is to read in environ.dat (must be in root), change linefeeds
X    to nulls and delete the carriage returns and put nulls at the
X    end, then point the desktop environment to that buffer.)
X
X    What is also useful is that most shells will take these values
X    so you don't have to have a big profile.sh or login.sh files
X    just to set the environment.
X
X    Make sure all lines are of the form SYM=value, and don't put
X    any blank lines or spaces unless needed (see your shell docs).
X
X    Source is included for the curious.

Submitted-by: logajan@ns.network.com (John Logajan)
Posting-number: Volume 2, Issue 66
Archive-name: norad

Below are two files generically named NORAD Release V1.0.
NORAD is a GFA Basic (2.0) implementation of a real-time
multiple earth satellite tracking program. Earth satellites
are graphically depicted against a map of earth's continents.
It is a very pretty display in my humble opinion.

A sample orbital elements file containing 98 satellites is
included, but I suggest you make an effort to get ahold of
the most recent released elements if you want to accurately
track satellites.

Thanks -- John Logajan.

```
#       This is a shell archive.
#       Remove everything above and including the cut line.
#       Then run the rest of the file through sh.
#----cut here-----cut here-----cut here-----cut here----#
#!/bin/sh
# shar: Shell Archiver
#       Run the following text with /bin/sh to create:
#       norad.lst
#       orbitals.dat
cat << \SHAR_EOF > norad.lst

Rem -- SYMBOL TABLE -- (ala Clark and Tilley)
Rem A0 = SEMI-MAJOR axis
Rem A9 = Azimuth
Rem Cn = COSines, C(J,K) also
Rem E0 = eccentricity of orbit
Rem E8 = observer horizion
Rem E9 = satellite elevation
Rem G0 = GM of Earth
Rem G1 = Sidereal/Solar
Rem G2 = New Year's sidereal time
Rem G7 = GHA Aries
Rem H1 = Hours duration
Rem H3 = Hour epoch
Rem H4 = Hour
Rem H9 = observer height
Rem K0 = initial orbit #
Rem K  = orbit counter
Rem K7 = INT(T)
Rem L5 = SSP LATITUDE
Rem L8 = GEOCENTRIC latitude
Rem L9 = observer longitude
Rem M  = mean anomaly
Rem M0 = mean anomaly of ref epoch
Rem M3 = ref epoch minutes
```

```
Rem M4 = integer minutes
Rem M5 = difference in Transcendental Eq.
Rem N0 = mean motion
Rem O, O0 = R.A.A.N.
Rem P0,P1,P2 variations on a theme of PI
Rem Q,Q0 = total orbits
Rem R = ? in plane of orbit
Rem R5 = range
Rem R6 = previous range
Rem R9 intermediate for GEOCENTRICs
Rem Ss used for SIN
Rem T0 = ref time in orbit days
Rem W, W0 arg of perigee
Rem W5 = SSP W. long.
Rem W9 = observers W. long
Rem X0,Y0,R coord in plane of orbit
Rem X1,Y1,Z1 "    " INERTIAL CELESTIAL
Rem X,Y,Z in GEOCENTRIC coordinates
Rem X9,Y9,R9 are observer's GEOCENTRIC coordinates
Rem X5,Y5,Z5 ==> R5  vector from observer to satellite
Rem X8,Y8,Z8 are observer's LOCAL Coordinates

SHAR_EOF
cat << \SHAR_EOF > orbitals.dat

The most current orbital elements from the NASA Prediction Bulletins are
carried on the Celestial RCP/M, (513) 427-0674, and are updated several times
weekly.  Documentation and tracking software are also available on this
system.

The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud
using 8 data bits, 1 stop bit, no parity.

Submitted-by: Schutte@nikhefh.hep.nl (Klamer Schutte)
Posting-number: Volume 2, Issue 67
Archive-name: diff

Here is the source of a diff(1) program. I wrote it some time ago, but
decided to submit now because of questions of such in comp.sys.atari.st.

There is no other copyright on the program than mentioned in its header --
I am the writer myself.

Compile, enjoy!
Klamer.

Approved: koreth%panarthea.ebay@sun.com

Submitted-by: uunet.UU.NET!unido!sbsvax!roeder (Edgar Roeder)
Posting-number: Volume 2, Issue 68
Archive-name: emacs.diff/part01

Here are the context diffs from GNU-Emacs version 18.52 to the corresponding
atari st version. You need to get the original sources of emacs and apply
patch with this file as input.
You may want to wait for my patches to the GCC library before trying to compile
```

this. I am currently adding some comments and will post the library as soon as
possible.
The binary version of GNU Emacs 18.51 (ST) was posted in the binaries group.

- Edgar

[I have split this into two parts. You will need to stick them together
 manually before unsharring. -sg]

```
-------------------------------------------------------------------------------
#! /bin/sh
# This is a shell archive.  Remove anything before this line, then unpack
# it by saving it into a file and typing "sh file".  To overwrite existing
# files, type "sh file -c".  You can also feed this as standard input via
# unshar, or by typing "sh <file", e.g..  If this archive is complete, you
# will see the following message at the end:
#        "End of shell archive."

Submitted-by: uunet.UU.NET!unido!sbsvax!roeder (Edgar Roeder)
Posting-number: Volume 2, Issue 72
Archive-name: gcclib2/part01

This is my version of the gcc library. It was used to port GNU Emacs and many
other unix programs to the st. See the README for more details.
- Edgar

```
#! /bin/sh
# This is a shell archive.  Remove anything before this line, then unpack
# it by saving it into a file and typing "sh file".  To overwrite existing
# files, type "sh file -c".  You can also feed this as standard input via
# unshar, or by typing "sh <file", e.g..  If this archive is complete, you
# will see the following message at the end:
#        "End of archive 1 (of 7)."

XThis is my version of the GNU C compiler library. I used it to port GNU Emacs
Xto the Atari ST. I have included the original files when the diffs would be
Xlarger. Context diffs are produced against the current version at the
Xterminator archive server. Also included are some of the include files which
Xhave changed.  The changes are:
X    - Filenames are converted from unix to tos syntax and vice versa in
X      all file handling routines. So you need no longer worry about the
X      use of slashes in filenames when porting programs from unix. The
X      old writing with backslash is also supported.
X    - The time function now returns seconds since Jan 1 1970. All time
X      functions have changed to deal with this format.
X    - Error numbers are now positive (according to the ANSI standard).
X    - stat/fstat now get similar information than their unix counterparts.
X    - O_APPEND is now handled correctly.
X    - Some error checks have been included in string functions.
X    - crt0.s uses xArg parameter passing (also provided by Pexecv).
X    - Some routines now return more reasonable values than before (getpid).
X    - read recognizes Alternate as Meta key and gives escape sequences for
X      the function keys. O_NDELAY mode is now implemented.
X    - The signal stuff was almost completly rewritten. More signals are
X      now possible. SIGINT as generated by tos can be ignored. SIGTSTP
X      gives you an interactive shell. SIGALRM and SIGHUP are served even in
X      the middle of an operating system call.
X    - The bindings in osbind.h have been rewritten to inline functions. Now
X      they are faster and (for Super()) more correct.
X    - Resident shells at _shell_p are recognized and can be accessed with
X      three new system calls.
X    - Information about the running time can be obtained from clock() or
X      times().
X    - atexit() is now supported.
XWhenever possible i tried to make my routines conforming to the new ANSI C
Xstandard or the corresponding unix-library functions. Because porting is easier
Xif you have a good library, if i had to choose between a change in a program
Xor a new library routine, i most of the time took the latter decision.
XSure there would be only some small changes for this particular program.
X
X- Edgar

#! /bin/sh
# This is a shell archive.  Remove anything before this line, then unpack
# it by saving it into a file and typing "sh file".  To overwrite existing
# files, type "sh file -c".  You can also feed this as standard input via
# unshar, or by typing "sh <file", e.g..  If this archive is complete, you
# will see the following message at the end:
#        "End of archive 3 (of 7)."
# Contents:  alrm_nas.s include/errno.h include/signal.h include/stat.h
#   include/stdio.h include/stdlib.h ioctl.c.cdiff open.c
#   opendir.c.cdiff st-error.c std-init.c time.c trap-1.c trap-13.c
#   write.c.cdiff
# Wrapped by roeder@sbsvax on Wed Aug 16 22:03:00 1989

X|       Cross Development System for Atari ST
X|      Copyright (c) 1988, Memorial University of Newfoundland
X|
X|   At this point we take over from dos - we know (think?) that the stack
X| looks like this now:
X|   0    long pc
X|   4    long arg (pointer to d7 below)
```

```
X|       (stuff - unknown size - depends on compiler - could be size 0)
X|       long pc
X|   *4   long d7
X|   *4+0x4    long a0
X|   *4+0x8    long d0
X|   *4+0xc    long d1
X|        .
X|        .
X|   *4+0x24   long d7
X|   *4+0x28   long a0
X|        .
X|        .
X|   *4+0x40   long a6
X|   *4+0x44   word sr   status register from exception
X|   *4+0x46   long pc   pc from exception
X|       stuff
X|  The stratagy at this point consists of saving the exception sr/pc and puting
X| out own address in place of the pc.  When the system does it's rte we get
X| called and we call raise (which can call some routine which can do a
X| longjmp).  If raise returns then we restore the sr/pc and do a rte.
